6. Basic notions

Before starting to print a file, the user must consider the following aspects:

File type: The file to be printed must have a format compatible with the printer that will be used. The most common file formats for printing are PDF, DOC, XLS, PPT, JPG, PNG, etc.

Printer Configuration: The user must verify that the printer is configured correctly. To do this, you must consult the printer's instruction manual.

Printing materials: The user must verify that they have the necessary printing materials, such as paper, ink or toner.

Specific aspects to consider

Bleed: Bleed is an additional margin added to document elements to prevent them from being cut off if there are imperfections in cutting or folding. The minimum bleeding is usually 3 mm.

Fonts: If the document uses non-standard fonts, the user must ensure that these are installed on the printer. Otherwise, the fonts can be attached to the print file. Paper size and orientation: The user must select the appropriate paper size and orientation for the document they want to print.

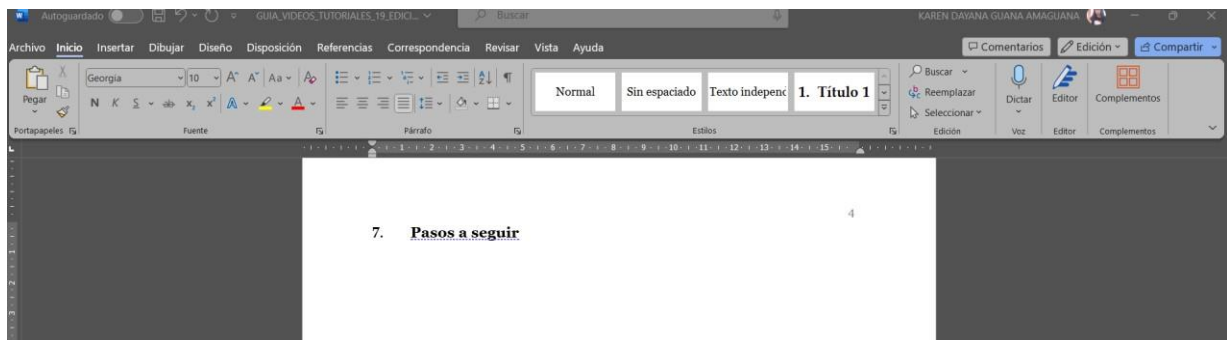

Print quality: The user can select the desired print quality, which can vary from the cheapest to the highest recommendations.

Before printing an important document, it is advisable to perform a test print to verify that the result is as desired.

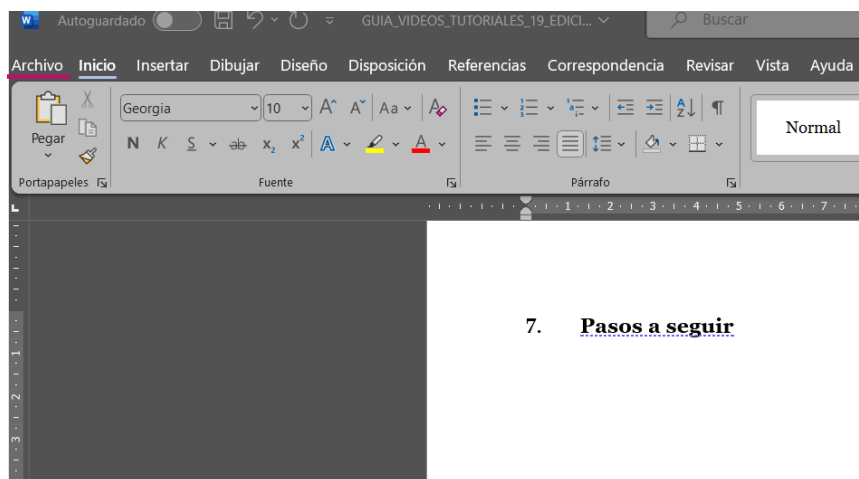

If the document is large or complex, it is advisable to use a professional printer. With these basic aspects in mind, the user will be able to print files correctly and obtain the desired results.
