1. Project Objectives

To train teachers from the Ministry of Education in the use of ICT tools to enhance their performance in teaching, aiming to promote educational innovation and online learning.

To train priority groups or digital illiterates in the use of ICT tools to apply what they have learned in their daily lives, promoting their digital inclusion and improving their quality of life.

2. Manual Objective

To train priority groups or digital illiterates in the use of Microsoft application, OneNote, through written and sequential explanations.

3. Scope

This manual aims to instruct priority groups or digital illiterates in the use of OneNote. It will cover basic and essential functions for using the application, without delving into overly complex features, as they have been deemed unnecessary for everyday use.

The functions considered for this manual include: creating a notebook, sections, pages, or notes; using styles and tags; inserting images, shapes, files, and more; drawing-related functionalities, such as using the virtual pen; explanations on page formatting, information on changing the page background or style; and, finally, how to export and print pages.

While it is targeted towards a specific group, anyone can use this manual as its information is basic and explained step by step with simple language to cater to anyone who may need it.

4. Targeted Audience

Priority groups.

Elderly individuals.

Individuals with incomplete high school education.

Digital illiterates.

General public.

5. Application Introduction

OneNote is a Microsoft application that allows you to create notes in a workspace, similar to other tools from its developer, it has a wide variety of functions. To begin, let's start with the basics: it allows you to create a space called a notebook, where you can create different sections, and within each section, you can have a specific number of notes or pages.

The application handles different writing styles, with functions to stylize the text, such as: bold, italic, underline, highlight, strikethrough, among others. Additionally, it features indicators and symbols grouped into what the application calls tags. Tags allow you to symbolize different texts on the page, some examples of these markers are code, tasks, important, question, among others.

Like other Microsoft tools, OneNote allows you to insert various elements on pages or notes, such as images, shapes, files, tables, Excel spreadsheets, among others.

The application has a dedicated drawing tab, as virtual note-taking applications often include this for when the user wants to use a digital pen. This tab allows you to choose a tool for writing or drawing, such as pens or highlighters, and you can also change the thickness and color of the tip.

Regarding the formatting of notes, there are several aspects where you can make changes; you can establish a layout similar to that of a notebook or agenda, so that the user feels more comfortable. Similarly, you can change the background color to different pastel shades so that the writings are not overshadowed. Finally, regarding formatting, there is a function to change the application theme to a dark mode, thus favoring the user's eyes and comfort.

OneNote keeps a record of changes on pages, as it has a history that the user can review at any time. When taking notes or recording writings, it is possible to make involuntary errors or delete something without realizing it, so this function allows the user to review all the changes made on the page, to decide if they want to restore something from the history.

For users who synchronize and backup all their information, OneNote also has a synchronization function, meaning that by activating this tool, the user's pages will be saved in the cloud and connected to the user's Microsoft account. When OneNote is synchronized, it is possible to view the notes from the computer on the phone, and to make any changes from either of these two devices; if the Microsoft account is signed in on another computer, the user will be able to see their notes on that device as well.

This application is very useful in educational settings, i.e., for people who are studying something, as it allows you to take notes or class notes while collaborating with others. The sharing function allows you to give permission for others to access the notes, which is the same as lending a notebook in real life, except now both parties can view the notes at anytime from anywhere, so no one wastes time reviewing or studying.

6. Basic Notions

The following basic notions are based on OneNote.

Notes or Pages: These are virtual spaces for writing notes or any information that can be written. Additionally, you can insert images, files, hyperlinks, phone numbers, home addresses, and code in a programming language.

Organization: The classification of pages or notes is as follows, from highest to lowest in organizational hierarchy first comes the notebook, then the sections, and lastly, the notes.

Formatting: Pages are like real-life blank sheets, where you can type information using the computer keyboard. They have no space limits, meaning you can write without constraints. Each note has a title and the date (day, month, year, time) it was created.

Extraction: Once a page is finished, it can be extracted from the computer, meaning it can be in the real world on physical paper. This can be done by printing, which will be explained in this manual. Additionally, pages can be saved on the computer for later review.

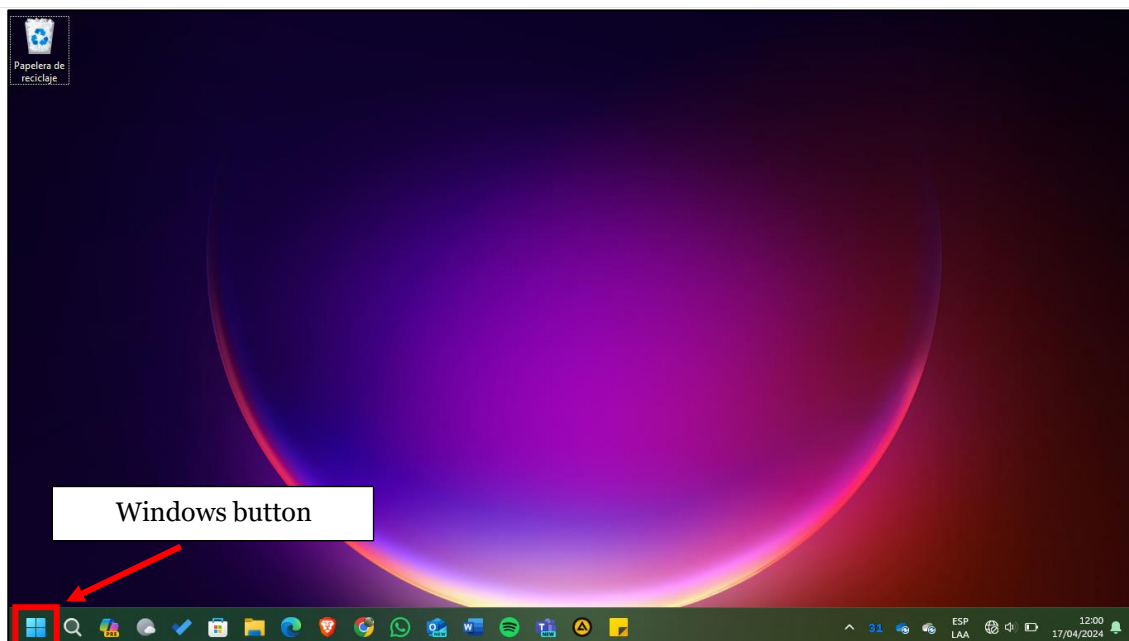

Help and Support: This manual provides a wealth of information about using the application. However, it does not cover all possibilities, so it's important to note that Microsoft Corporation (the creator of OneNote) has published a lot of information about using the application. Therefore, if more help is needed or further exploration is desired, it can be searched for online or in the application's own manuals.

Common Tools: Using a computer may seem strange at first, but once you get the hang of it, you can familiarize yourself with the most common functions, to the point that they appear in most applications. OneNote is no exception. Selecting text with the mouse, copying, pasting, and cutting, moving elements by dragging the mouse, are some of the general functions of a computer that can also be applied in OneNote.

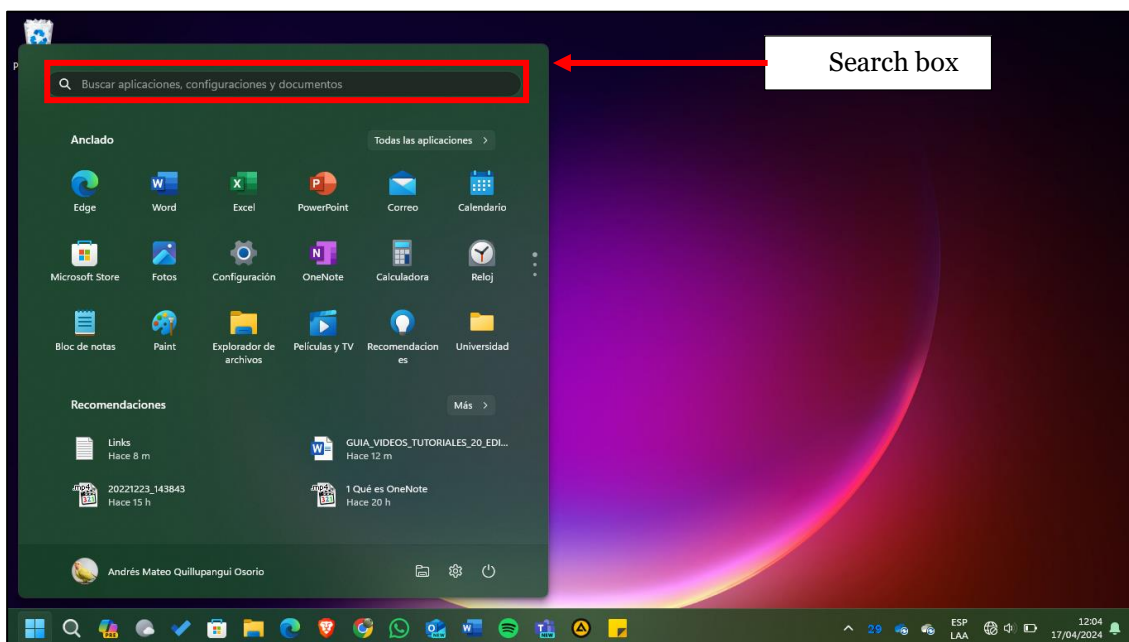

Search: In many areas of the application, you can find a general function on computers or technological devices, which is the search function. Therefore, when found, you can search for a specific item in all the notes you have available.

7. Steps to follow.

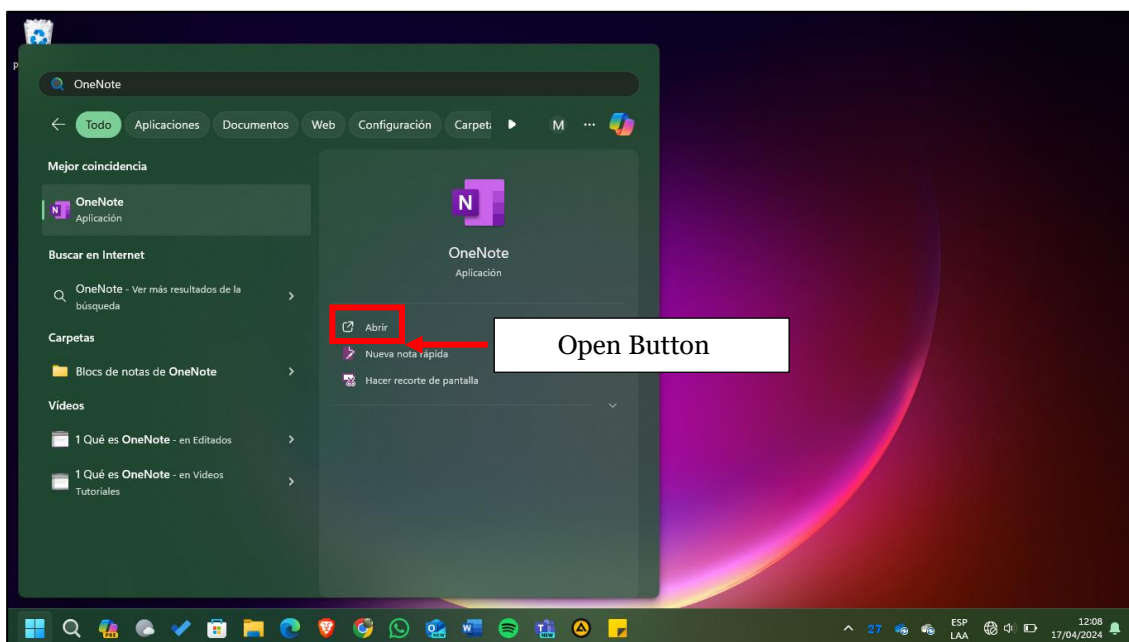

For this guide on how to use OneNote, "pressing" (clicking also) refers to clicking with the left mouse button.

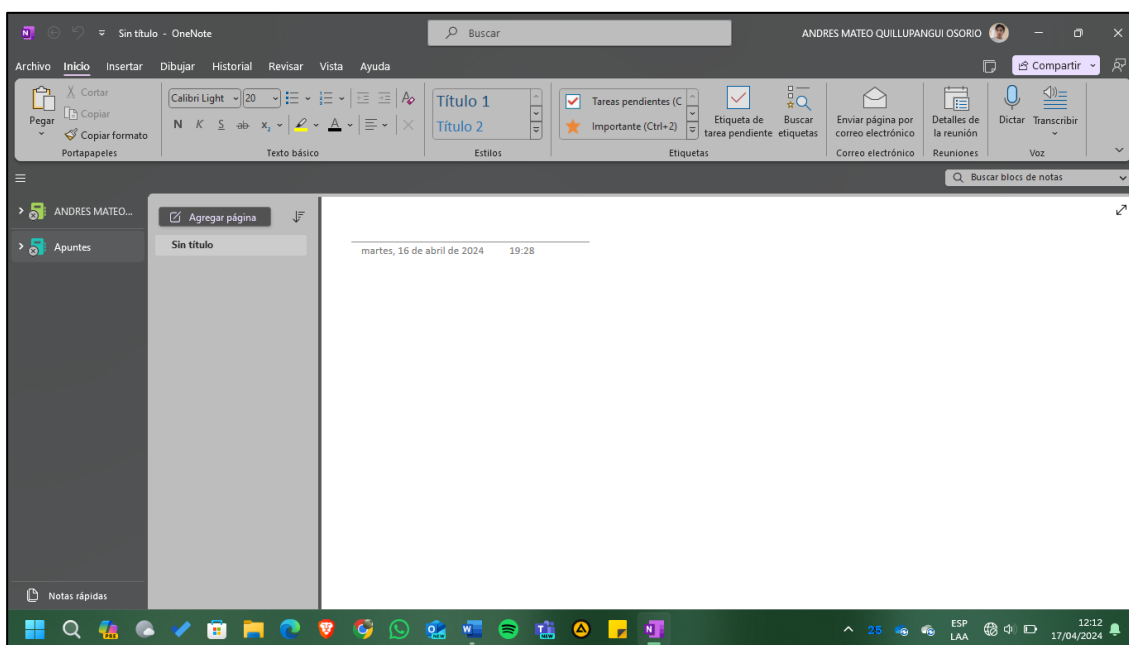

The OneNote application typically comes pre-installed on most Windows computers. To open it, we press the Windows button.

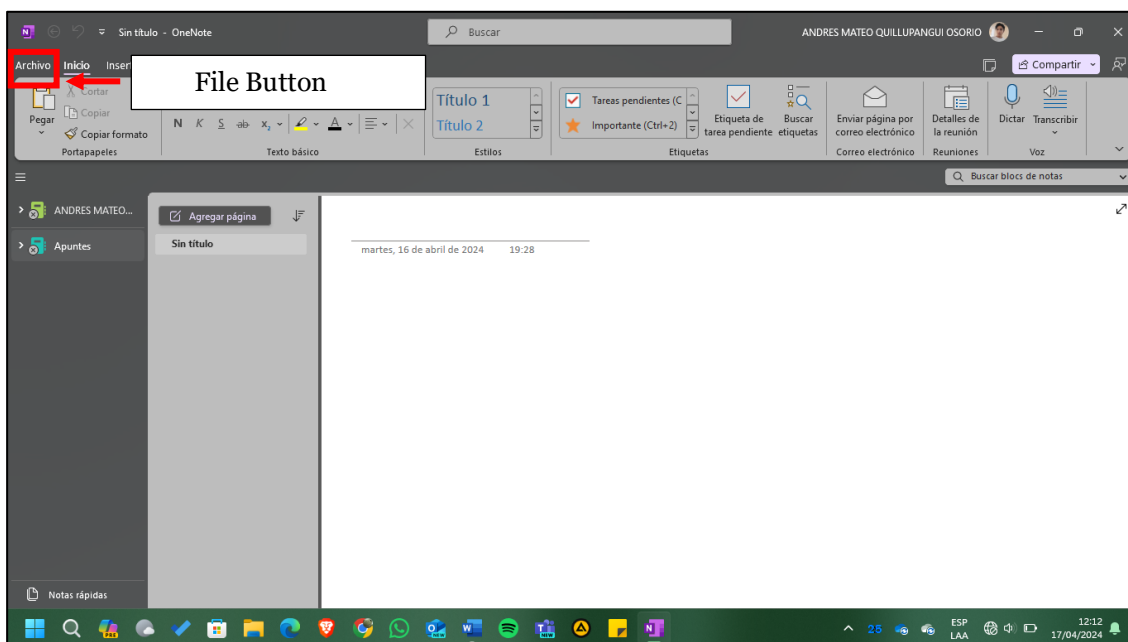

Now, click on the search box and type "OneNote", which results in the following image.

Click on the "Open" button and wait for the application to open.

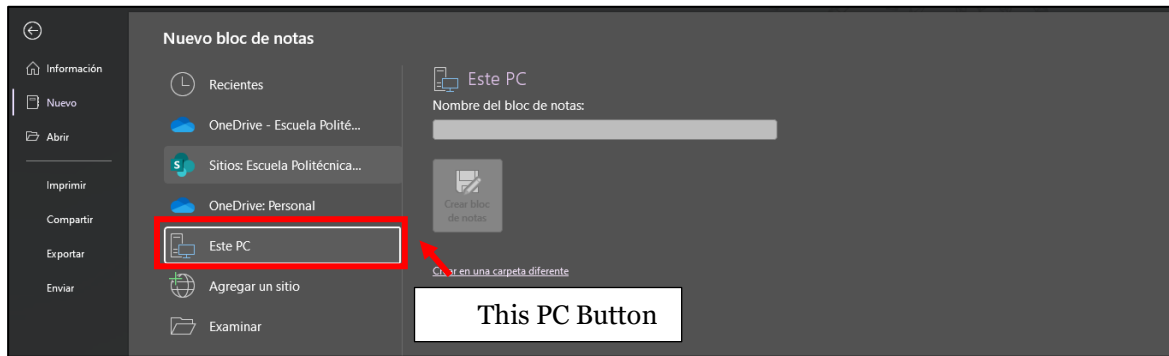

This is the first image or screen that appears when opening OneNote. Now, we will create the notebook.

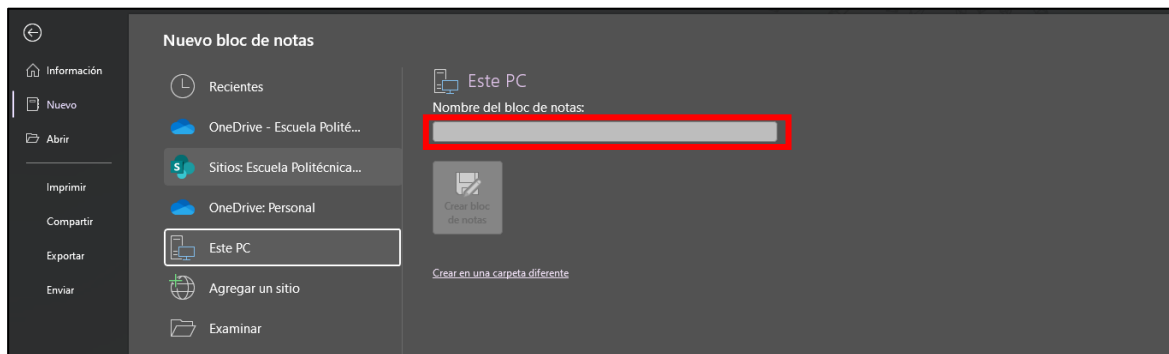

Press the “File” button.

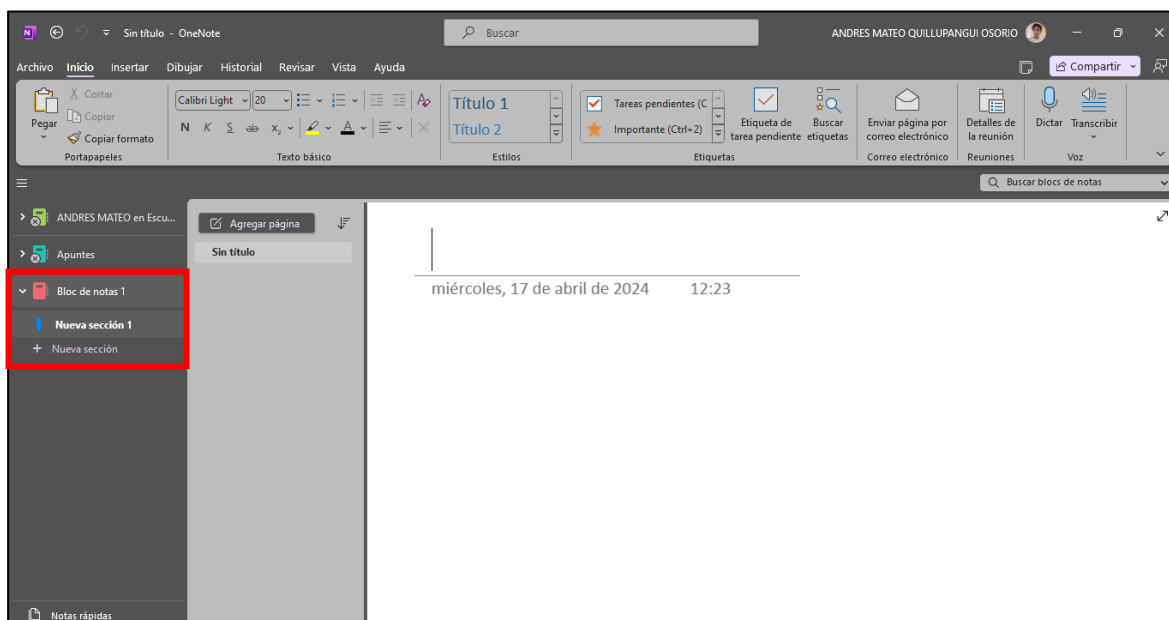

Press the “New” button.

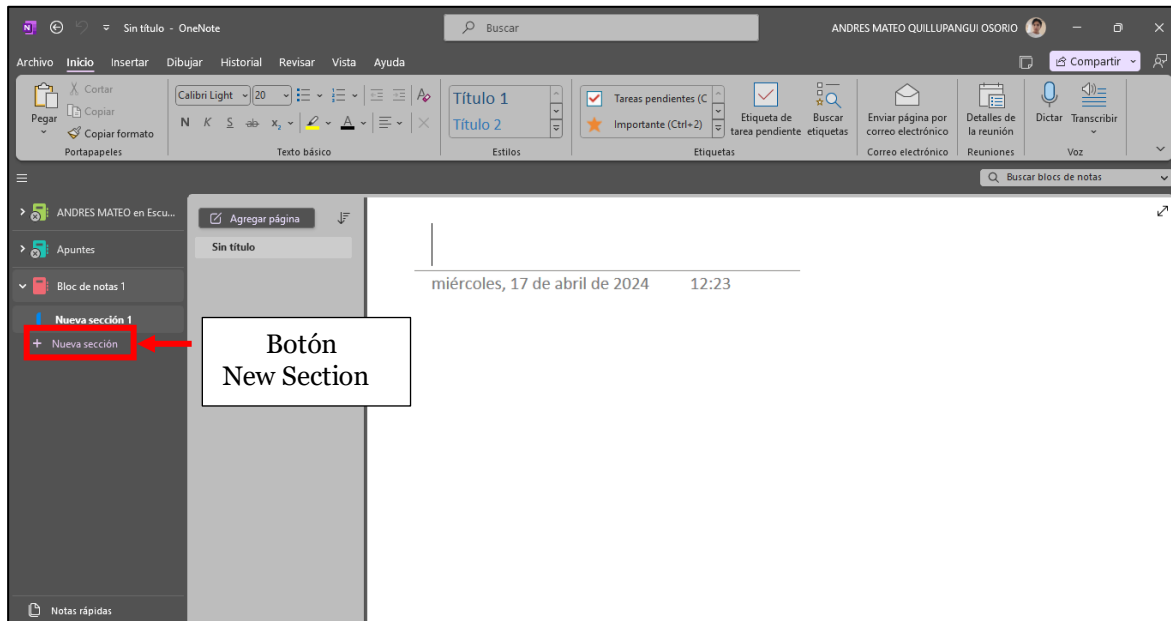

After pressing "New," the following screen will appear. Click on "This PC" to save the notebook in a default location provided by OneNote.

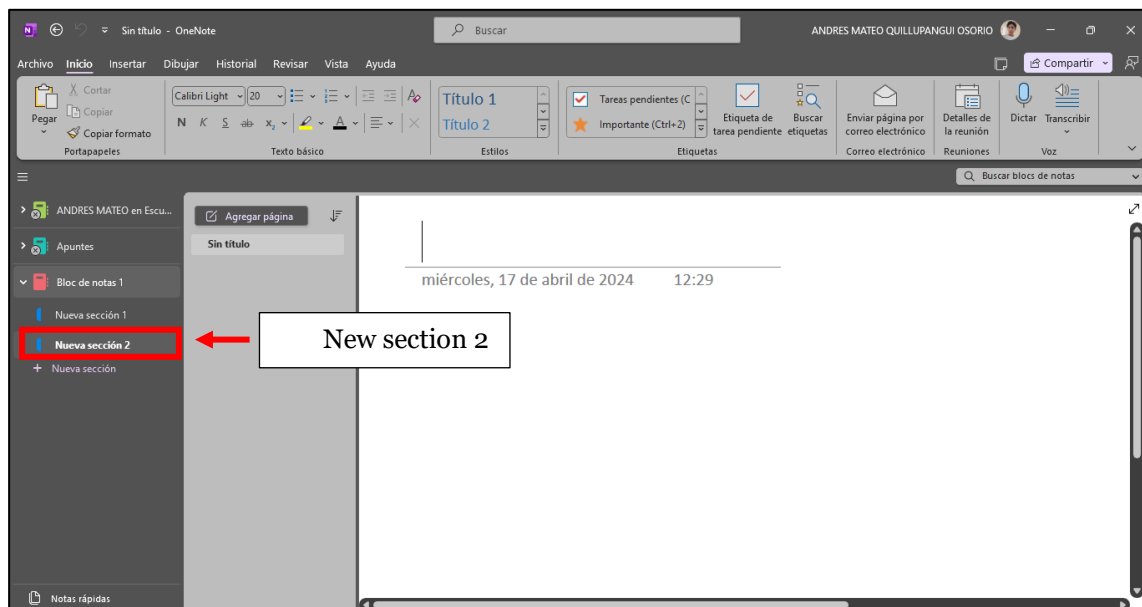

Click on the space indicated by the red rectangle and use the computer keyboard to enter a name. This name will be for the notebook that is going to be created. For this demonstration, we will enter the name: "Notebook 1", however, the reader of this manual can enter any name they prefer.

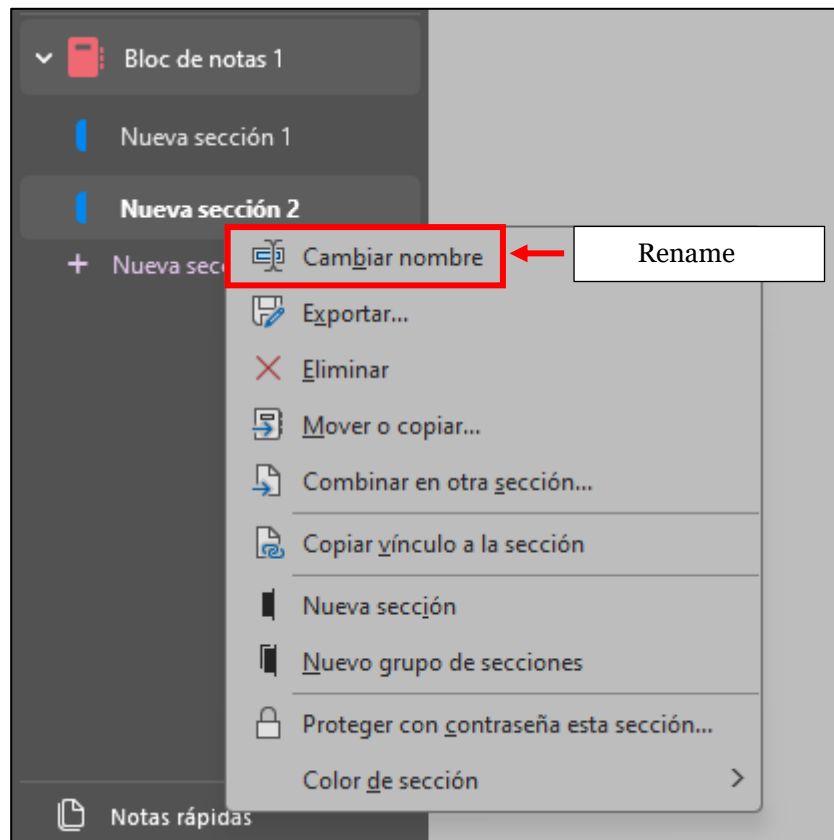

In the image, you can see the notebook created, it is indicated by the red rectangle. Now, we will create a section.

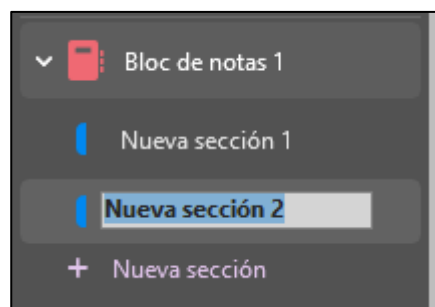

Click on the "New section" button.

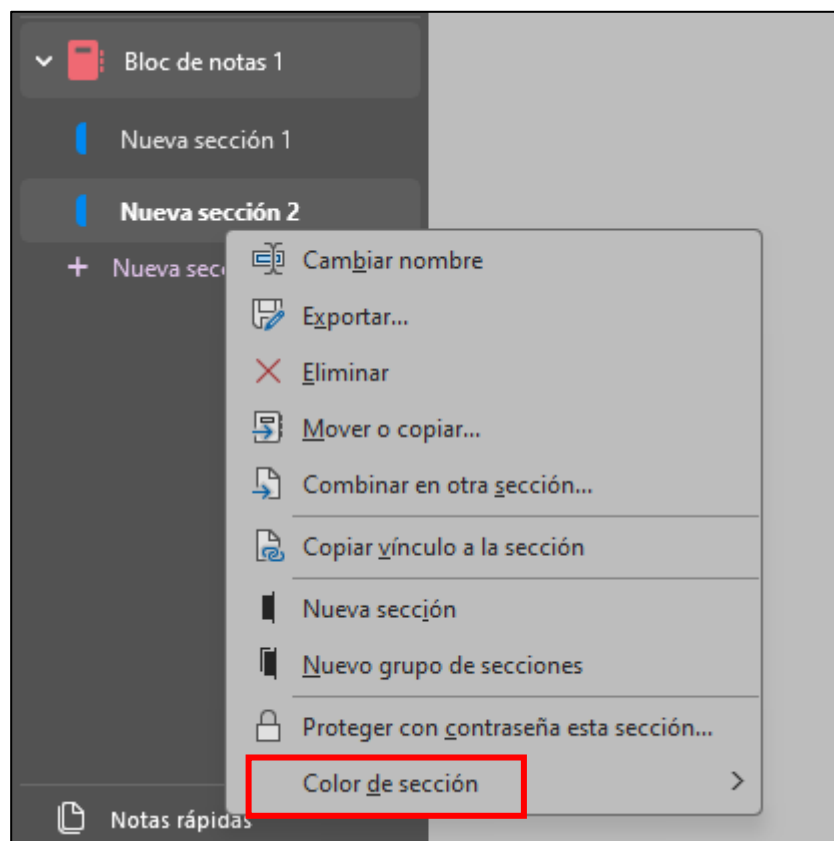

The "New section 2" has been created. Now, if you want to rename it or change its color, do the following. Right-click on the red rectangle.

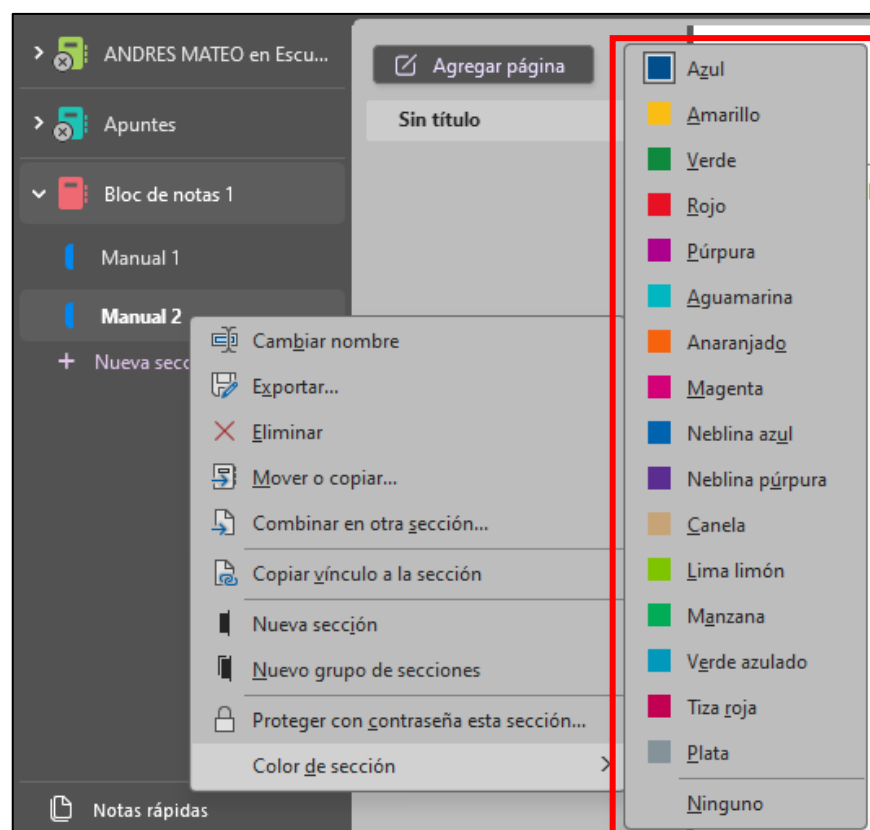

To change the name, press "Rename".

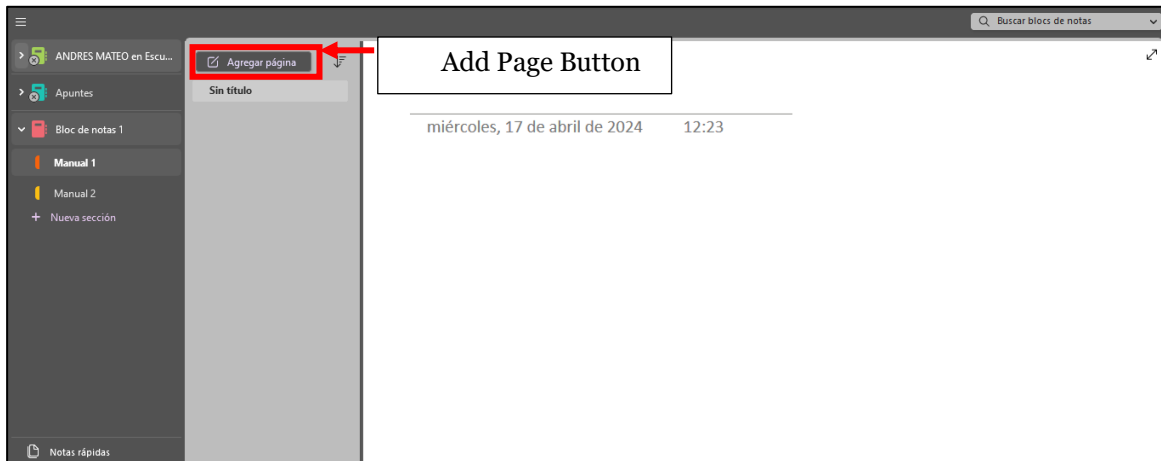

Type the new name for the section using the keyboard. For this manual, "New section 1" will be renamed to "Manual 1" and "New section 2" will be renamed to "Manual 2". Now, to change the color of the section.

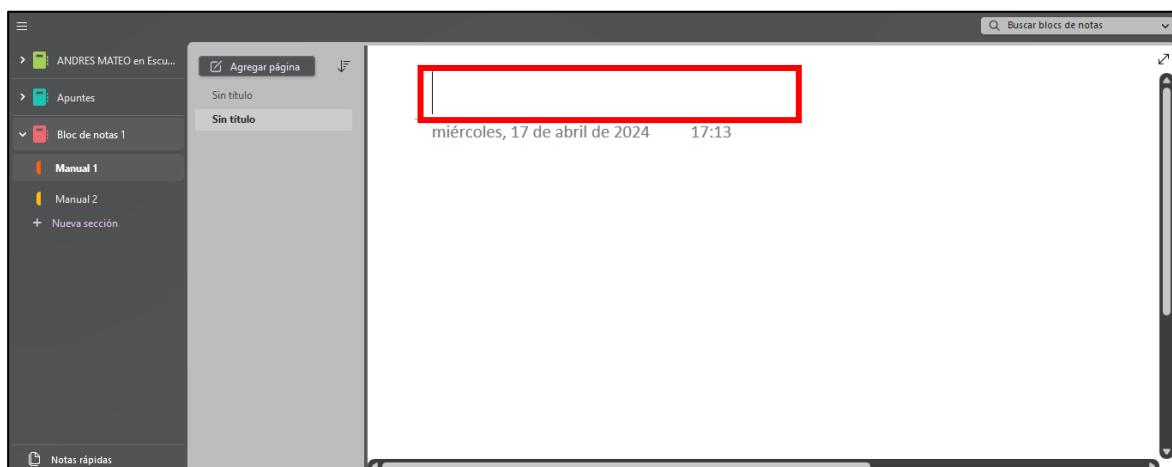

Hover the mouse cursor over the red rectangle, no need to press.

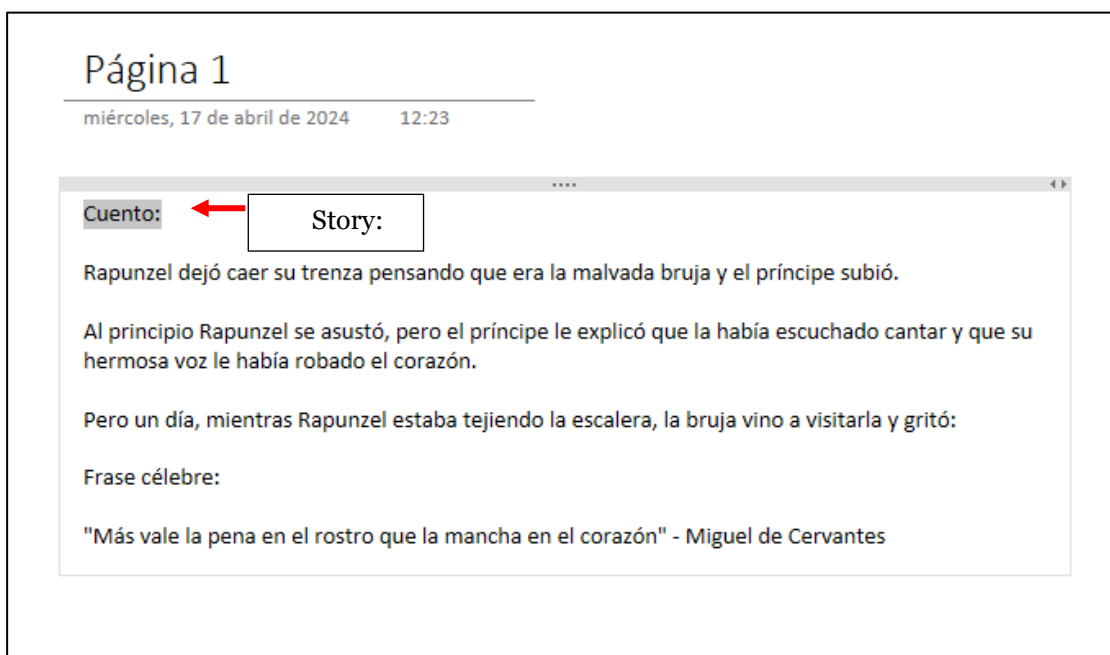

Choose one of the colors presented in the red rectangle; this will be the color of the section. Now, we will explain how to create a page or note for the section. Keep in mind that the page will be created in the section where the user is currently located. So, if you are in "Manual 1", the page will be created there.

A page is already created by default, but if you want to create another one, you press on the red rectangle, then on the "Add page" button.

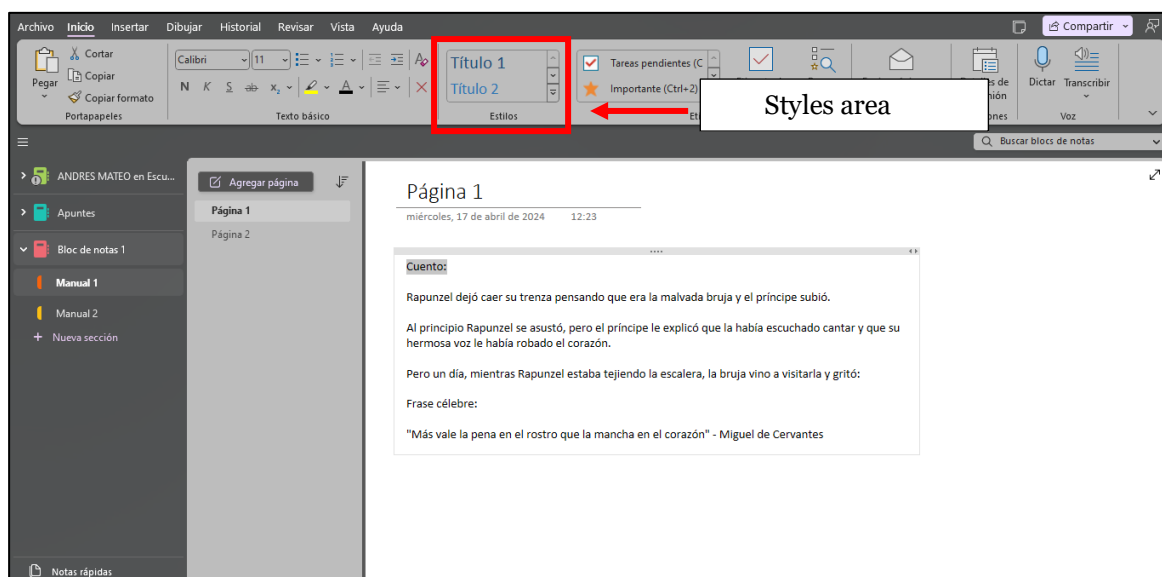

To give a title to a page or note, you should write in the space indicated by the red rectangle. This way, whatever is written in that space will be automatically assigned as the title of the page. Once you press "Add page," you just need to type the title using the keyboard. If you don't type anything, you simply press on the red rectangle to start typing in that space. To write inside the page, click anywhere on the page.

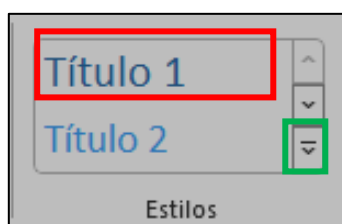

Once you have written something, you can add styles. To do this, first select the text you want

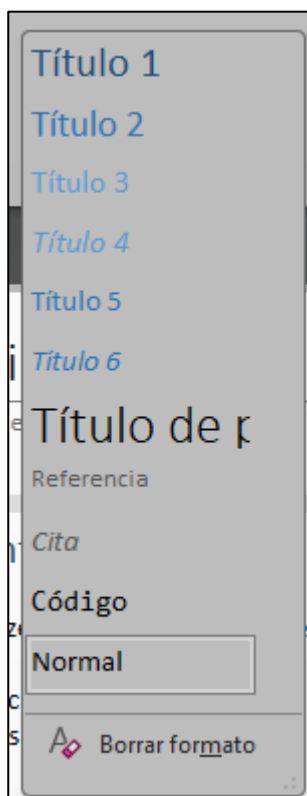

to modify with styles; click and drag the pointer over the text you want to select. In this example, we will select the part: "Story:".

Now, select the desired style, which can be found in the area marked with the red rectangle.

To select a style, click on what the red rectangle indicates. Now, if you want another style, out of all the ones available in the application, click the green square.

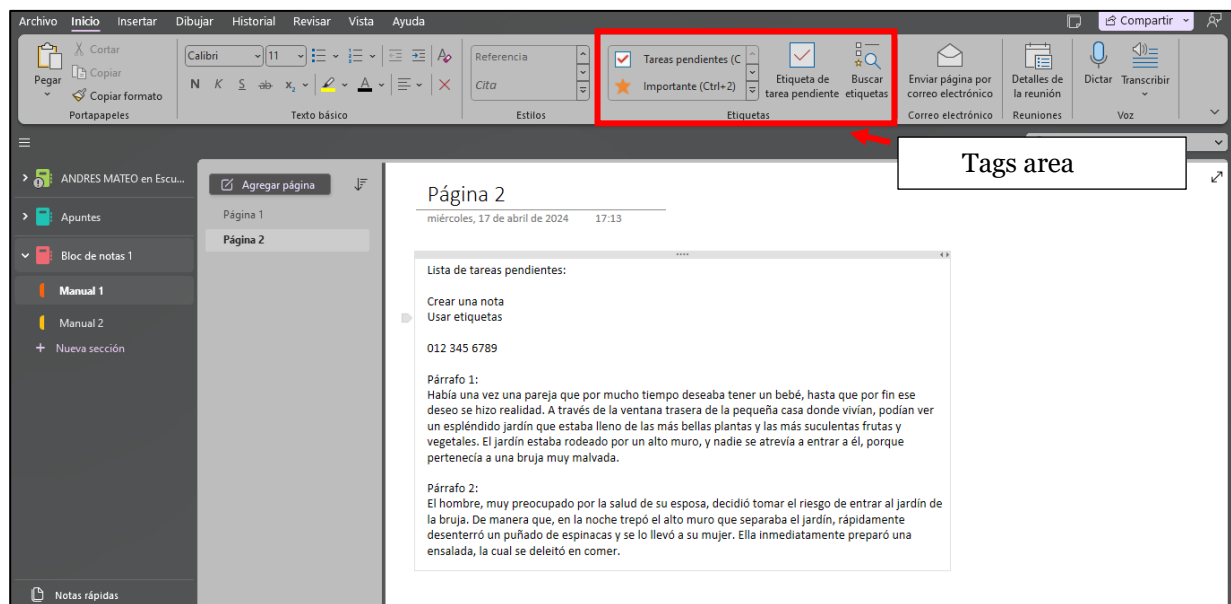

By clicking the green square, we get the following list with all the styles that can be applied. Next, we'll explain about tags, but before that, let's see how the initial text looks after applying

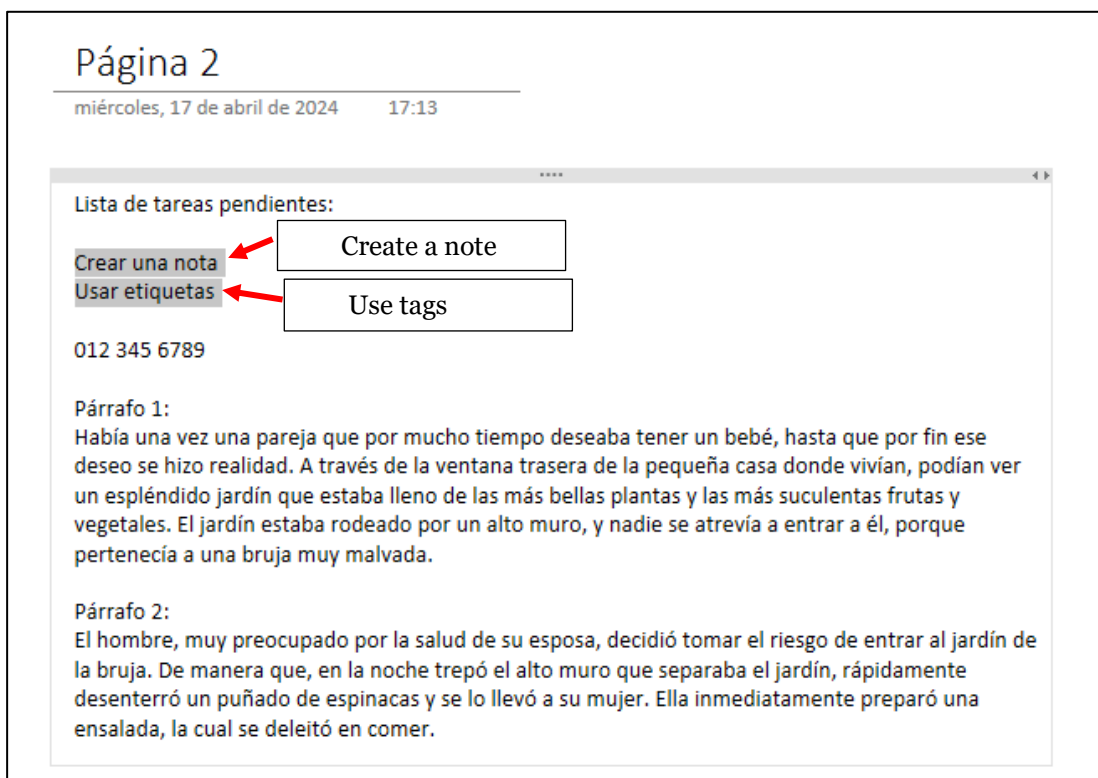

styles.

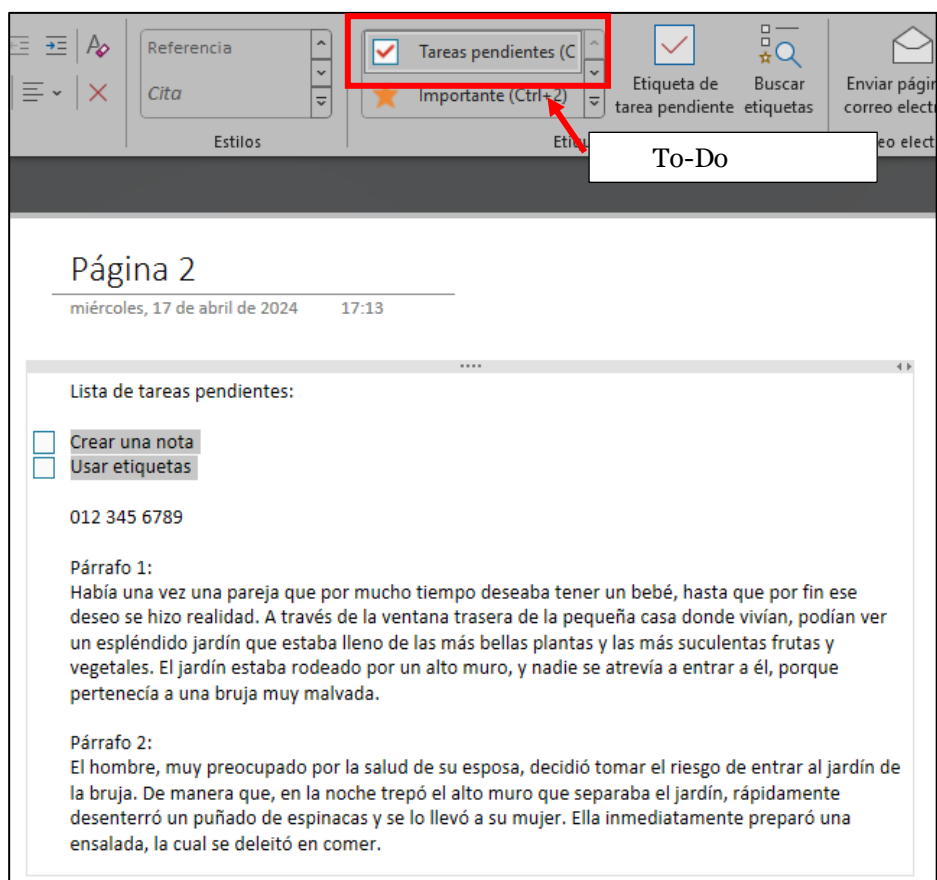

The style "Heading 1" was applied to "Story:", "Heading 2" to "Famous Quote", and the "Quote" style to "Better the head a little on the neck than a great deal on the shoulders" - Miguel de Cervantes."

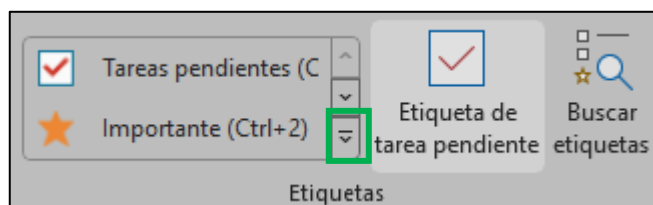

To use the tags, you have to use the area delimited by the red rectangle, and just like using styles, you first have to select a part of the text.

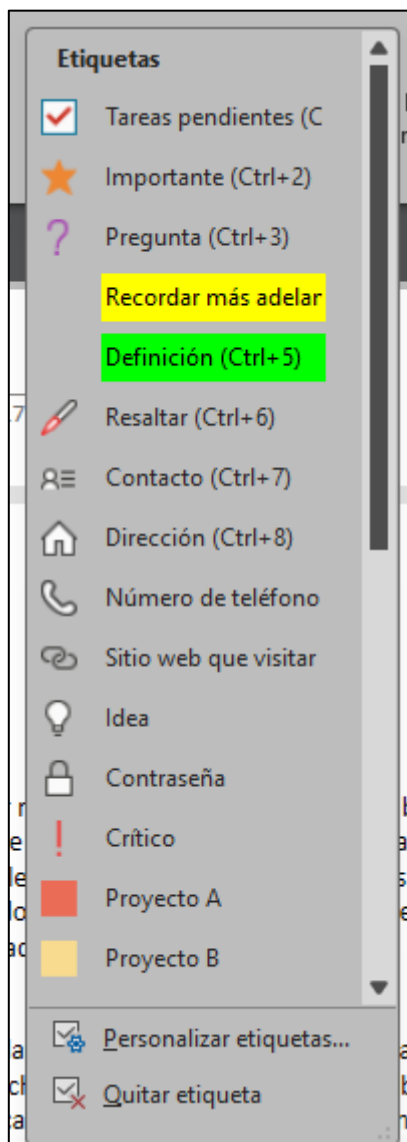

"Create a note" and "Use tags" have been selected to assign them a tag.

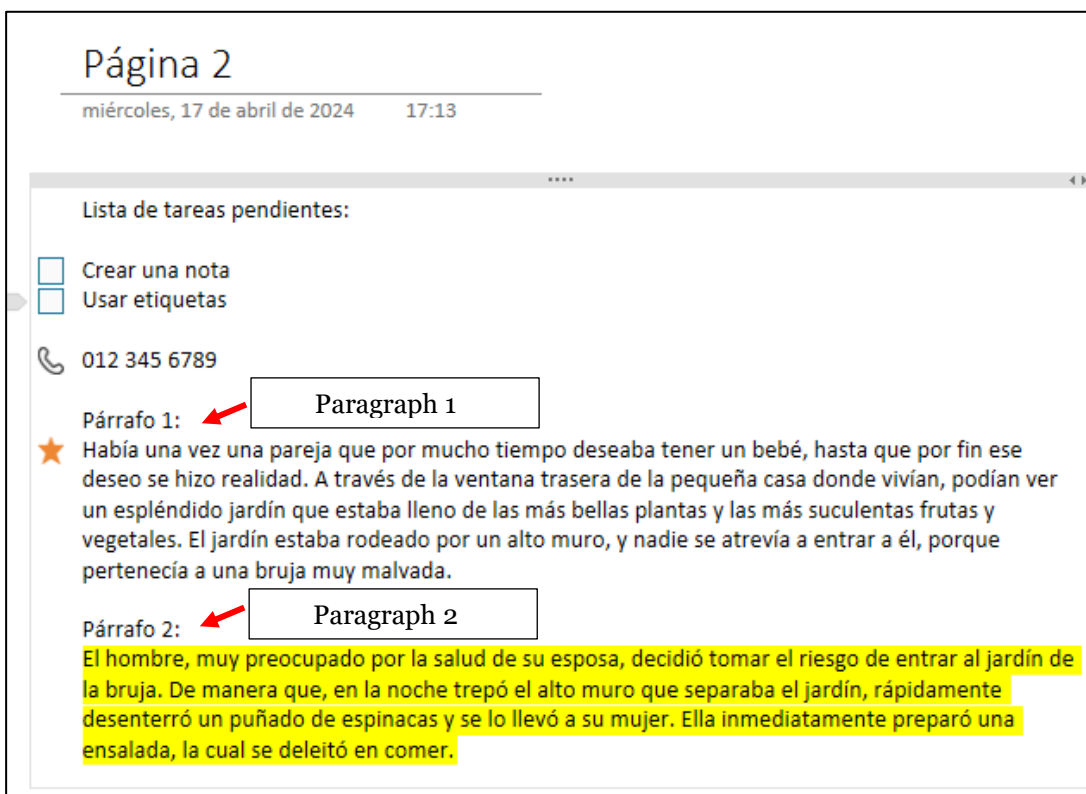

By pressing on "To-Do," that type of tag was applied to the two lines of text selected earlier. The blue boxes next to the lines of text now allow you to check them off, as if they were tasks on a list.

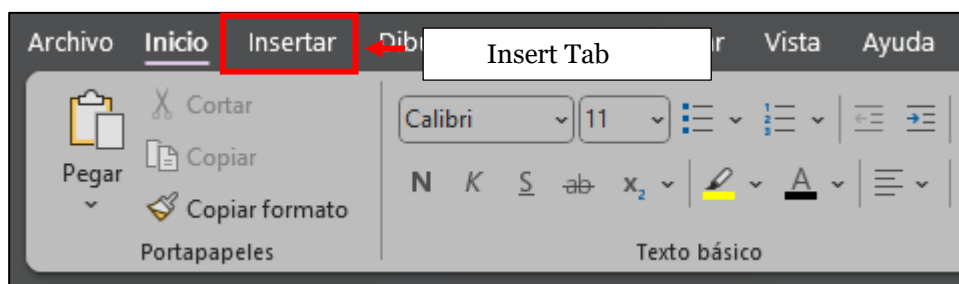

The green box indicates where to click to view the entire list of tags.

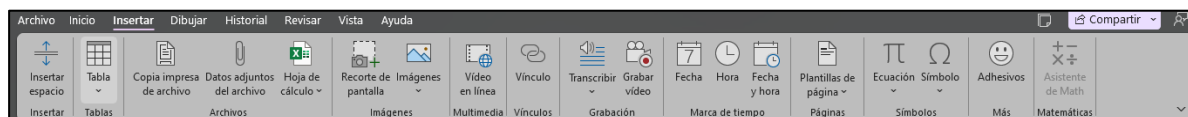

The following list is displayed with all kinds of tags to assign to the text in the note.

This is how the text looks after applying different tags. The "Phone Number" tag was applied to "012 345 6789", the "Important" tag to Paragraph 1, and the "Remember for Later" tag to Paragraph 2.

Now, functionalities in the "Insert" tab will be explained, for that, it is necessary to press it. The red rectangle indicates where it is on the screen.

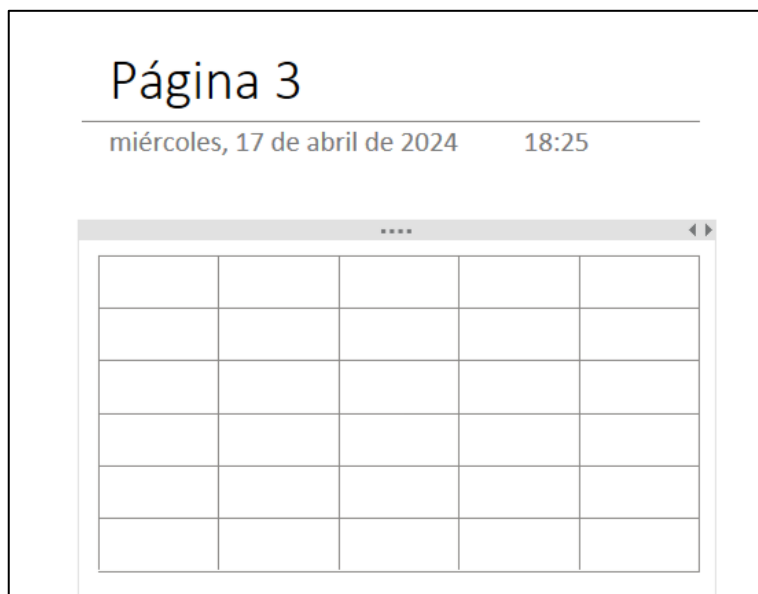

In the image, you can see all the functions in this tab.

To insert a table on the page, click the "Table" button.

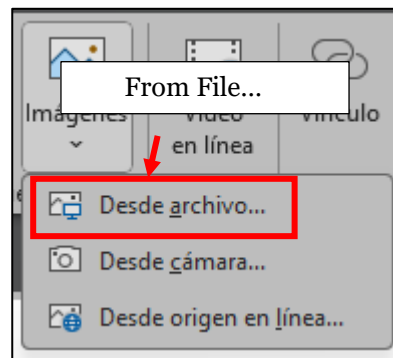

A box with square icons opens up; to set the dimension of the table, you need to click on one of the squares. For example, if you want a table that is 5 cells wide and 6 cells tall, click on the square marked in blue.

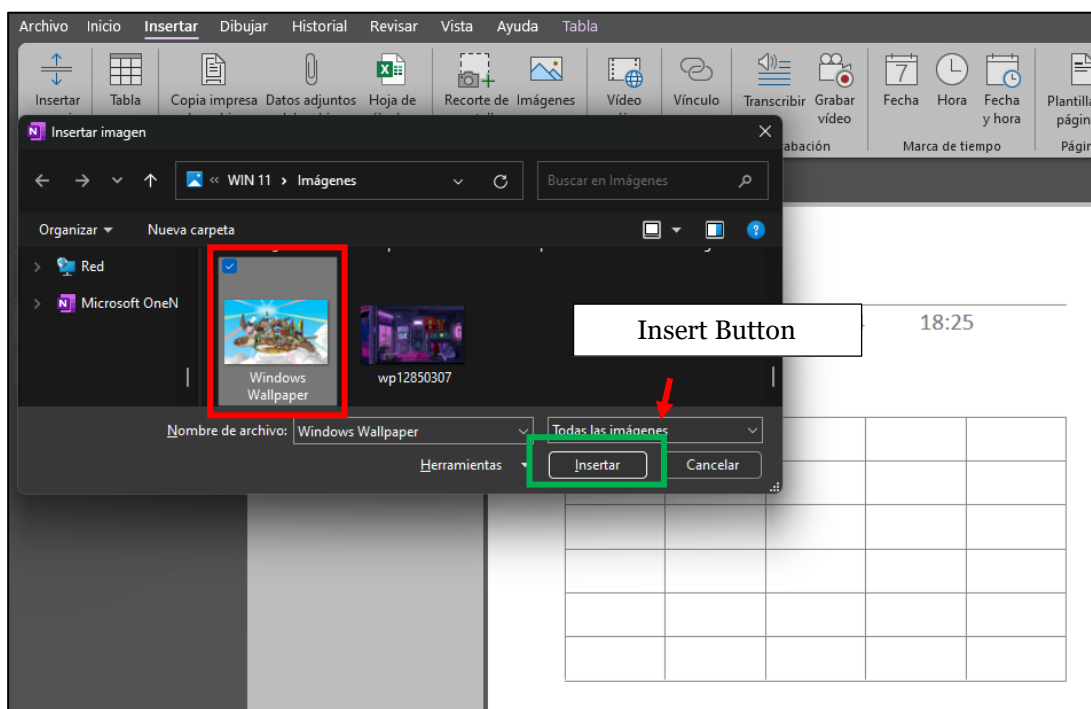

This is how the table would look on the page.

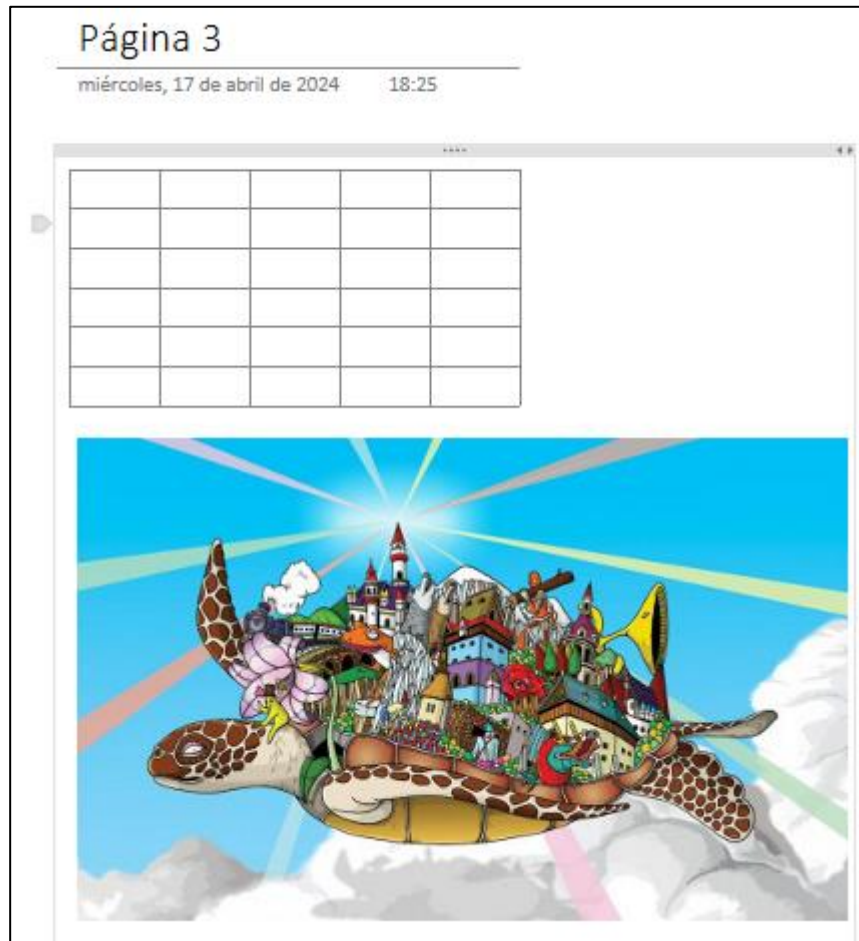

To insert an image from the computer, click on the "Pictures" button.

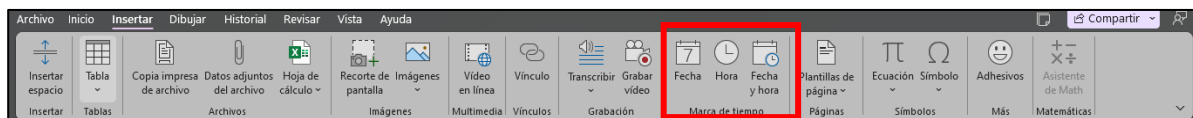

Click the "From File..." button to access the computer's files in search of the image.

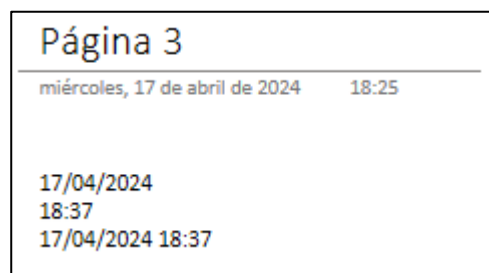

Once the image is found, click on it as shown in the red rectangle, then press the "Insert" button, which is presented in the green rectangle.

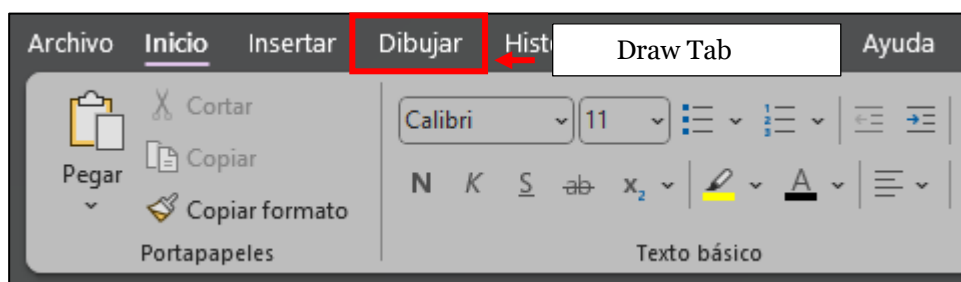

That's how the inserted image would appear on the page.

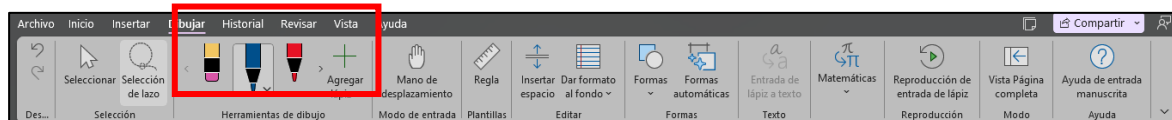

You can also insert time-related information. In the red rectangle, there are three buttons: the first inserts the date, the second inserts the time, and the third inserts both the date and time.

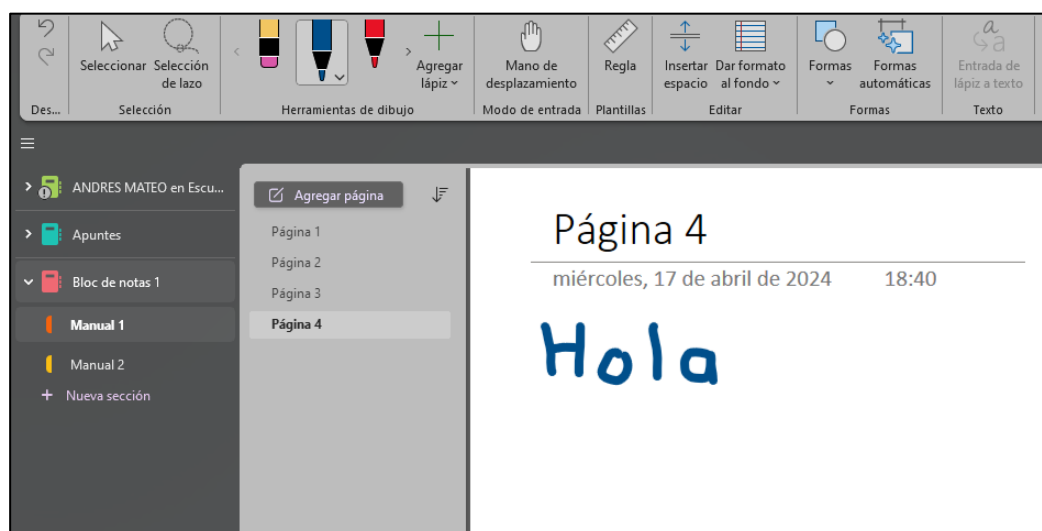

This is how the page looks after pressing each of them.

Now, the operation of the "Draw" tab will be explained.

In the red rectangle are the drawing tools for the page. For this demonstration, the blue color will be selected.

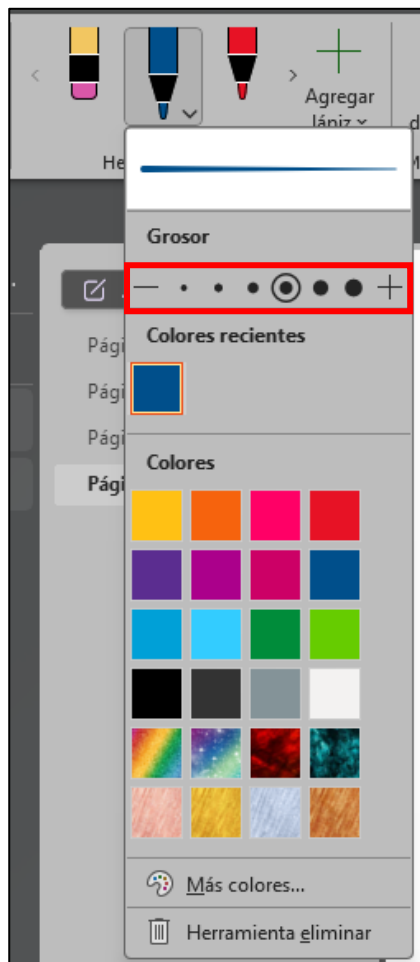

Using the cursor, as if it were a real-life pencil, you can draw or write on the page. Keep in mind that you have to hold down the left-click all the time you want to draw or write; releasing the left-click is like lifting your hand off a real-life sheet of paper.

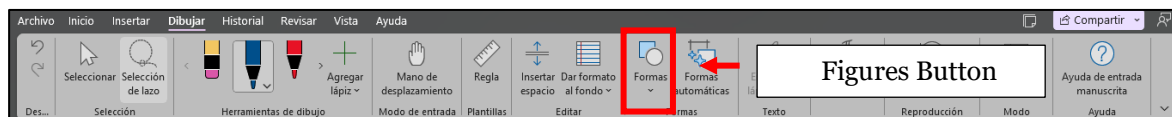

To erase something drawn or written, select the Eraser, indicated in the red rectangle, and move it over what you want to erase on the page.

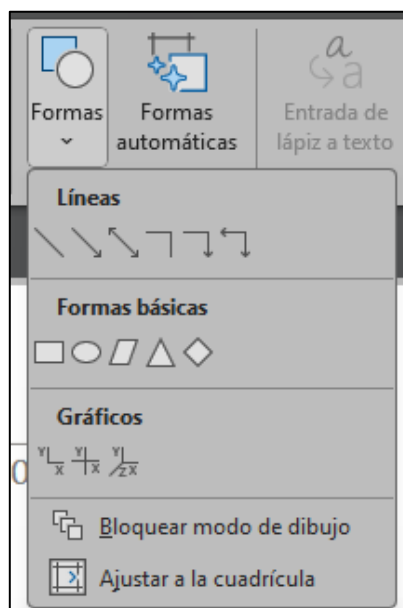

If you want to change the color or thickness of the virtual pen, you should press the arrow enclosed in the red rectangle.

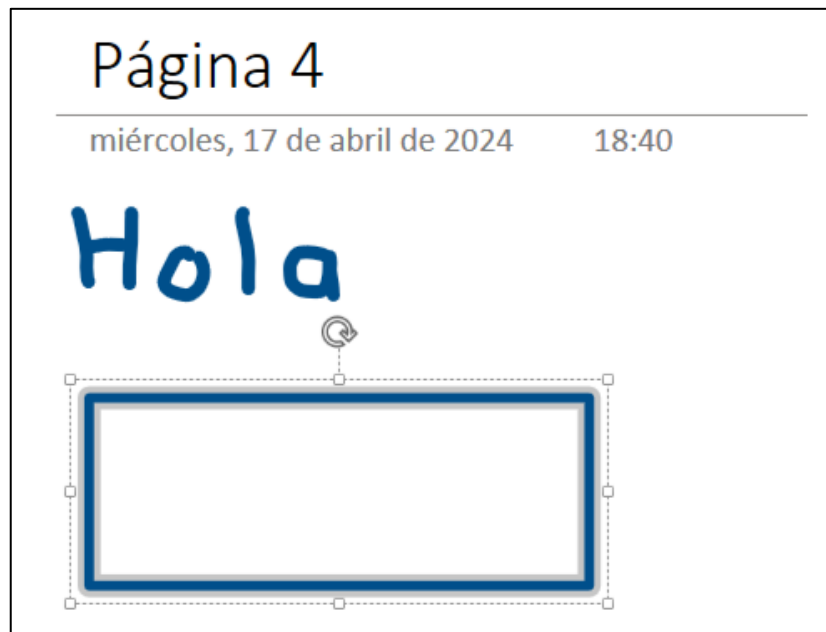

The following box is presented where you choose the color and change the thickness. The red rectangle indicates the different thicknesses for the virtual pen tip.

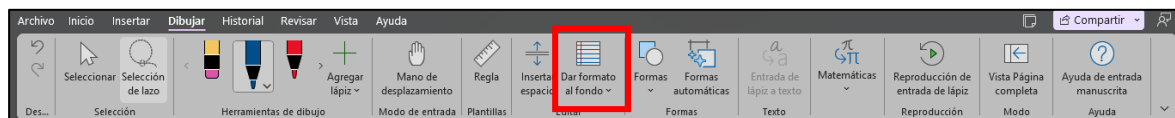

In the red rectangle, the button is indicated that allows you to insert shapes on the page.

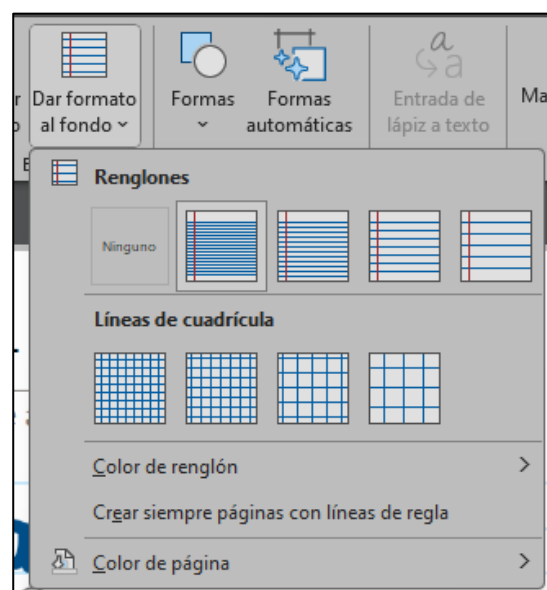

Pressing it opens a box with some shapes to insert; you just have to press on one of them and then on the page.

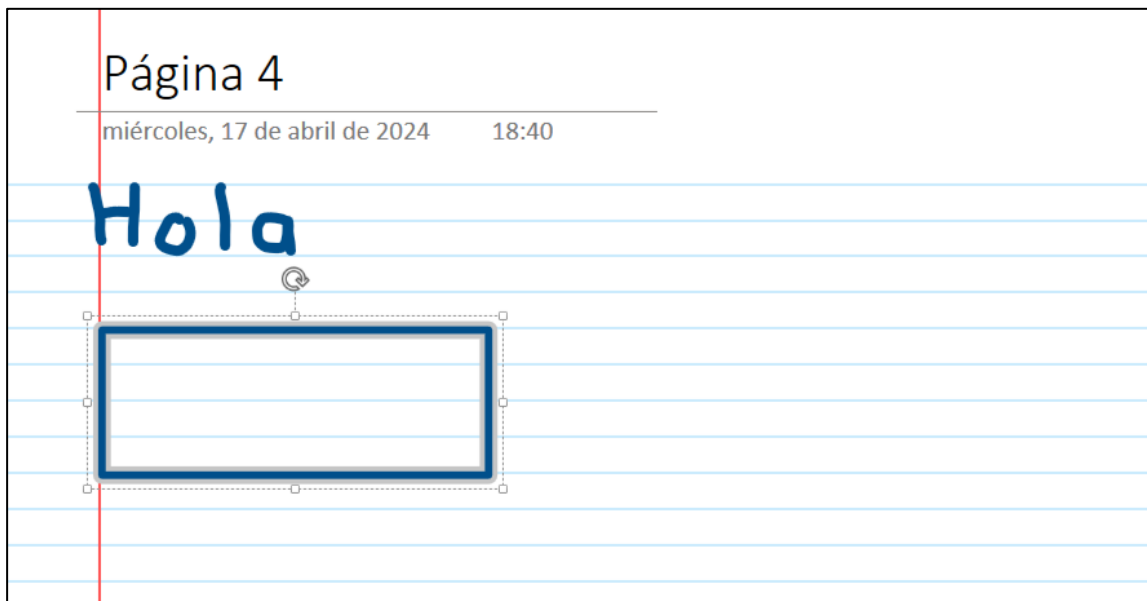

That's how the inserted shape would look.

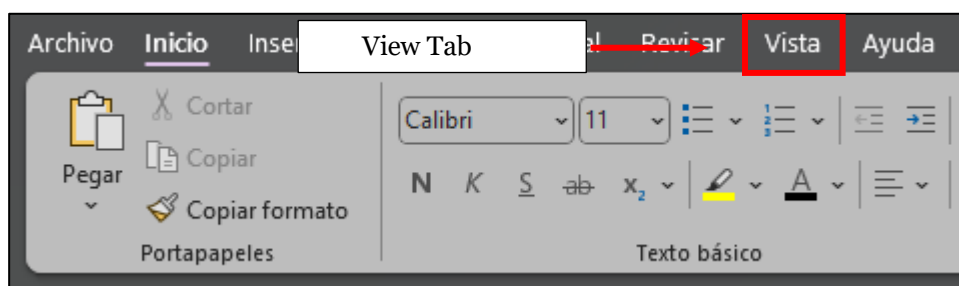

To change the page style, you should go to the button indicated by the red square.

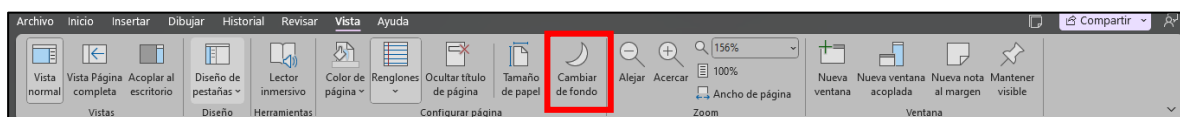

Upon pressing it, the following is displayed. Therefore, if we want the page to have lines (like real-life notebooks), we press the line that is preferred.

And that's how the page would look with lines. It's worth mentioning that this function is purely cosmetic, meaning it doesn't affect the writing inside the page at all; it's just to improve the design according to the user's preferences.

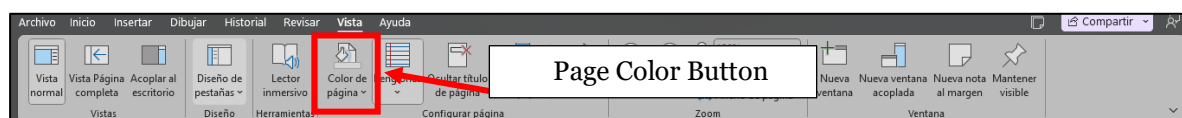

Next, we move to the "View" tab. It is shown in the red rectangle; what you have to do is click on it.

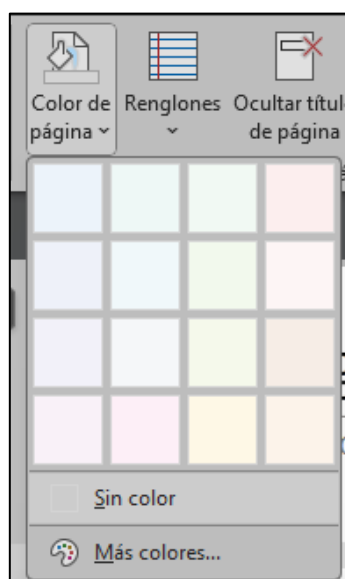

One function that may interest users the most is changing the background. This changes the page background to a dark one; this is for those who prefer this theme. What you have to do is press where the red rectangle is.

That's how the page would look with the dark theme.

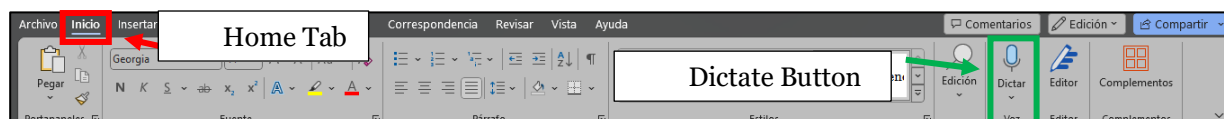

To change the page background, press "Page Color," where the red rectangle is located.

You can choose one of the 16 available colors or search for another color.

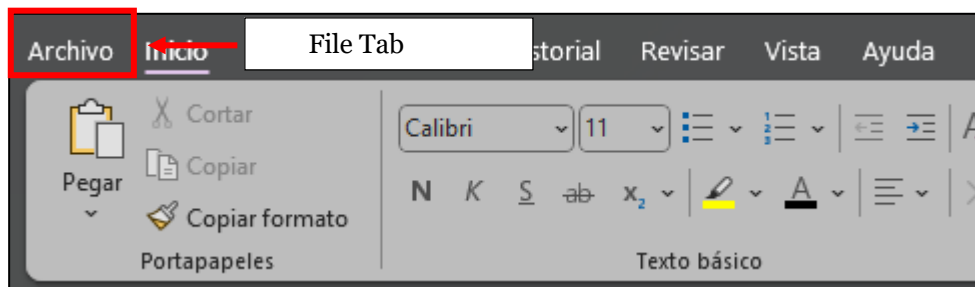

You can also zoom in or out of the page. To do this, press the "Zoom In" or "Zoom Out" buttons as desired.

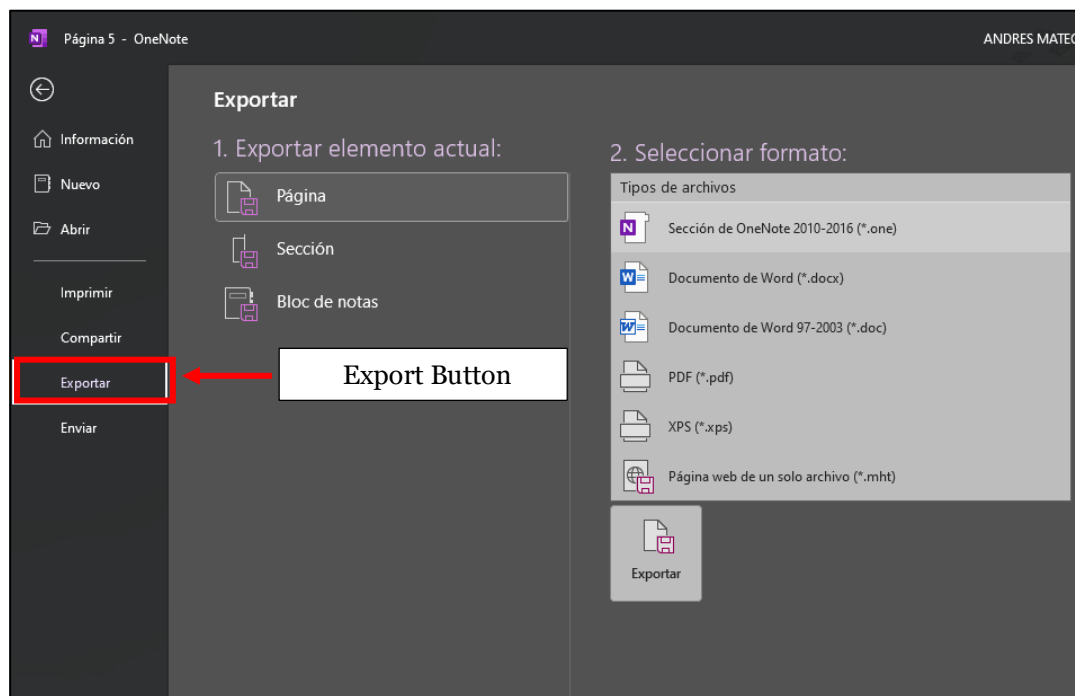

In the "Home" tab, there's the "Dictate" function, which allows the user to dictate to the computer to write what the person said. The "Home" tab is marked in the red rectangle, and the dictation function is in the green rectangle. It's worth mentioning that you need to have a microphone on the computer to use this tool.

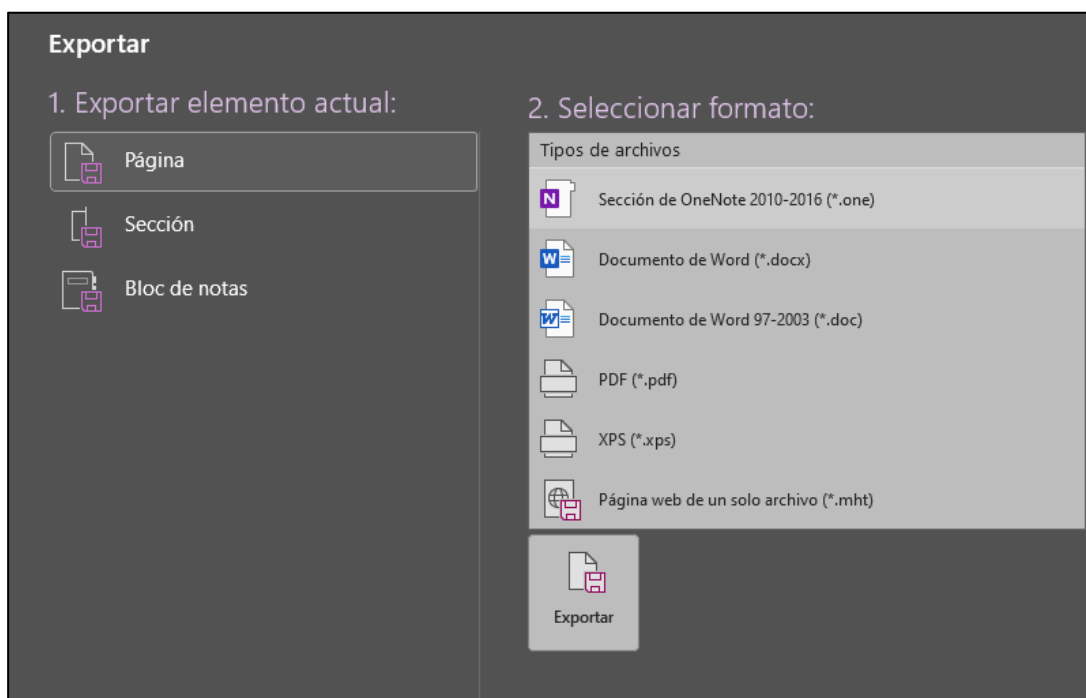

Once you press the "Dictate" button, the following box should appear; the purple microphone indicates that it is listening to what the person is saying, and it will be written on the page.

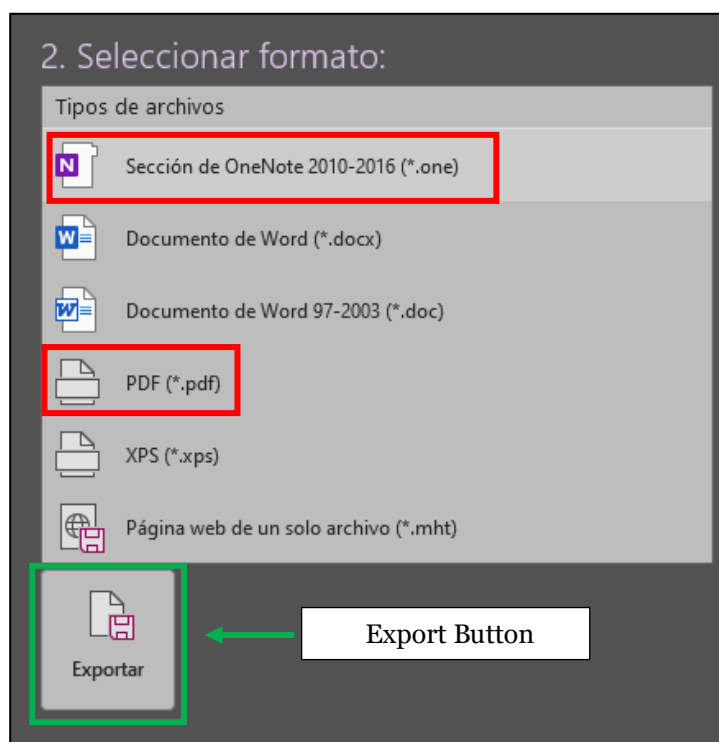

To export the pages or notes, you should go to the "File" tab.

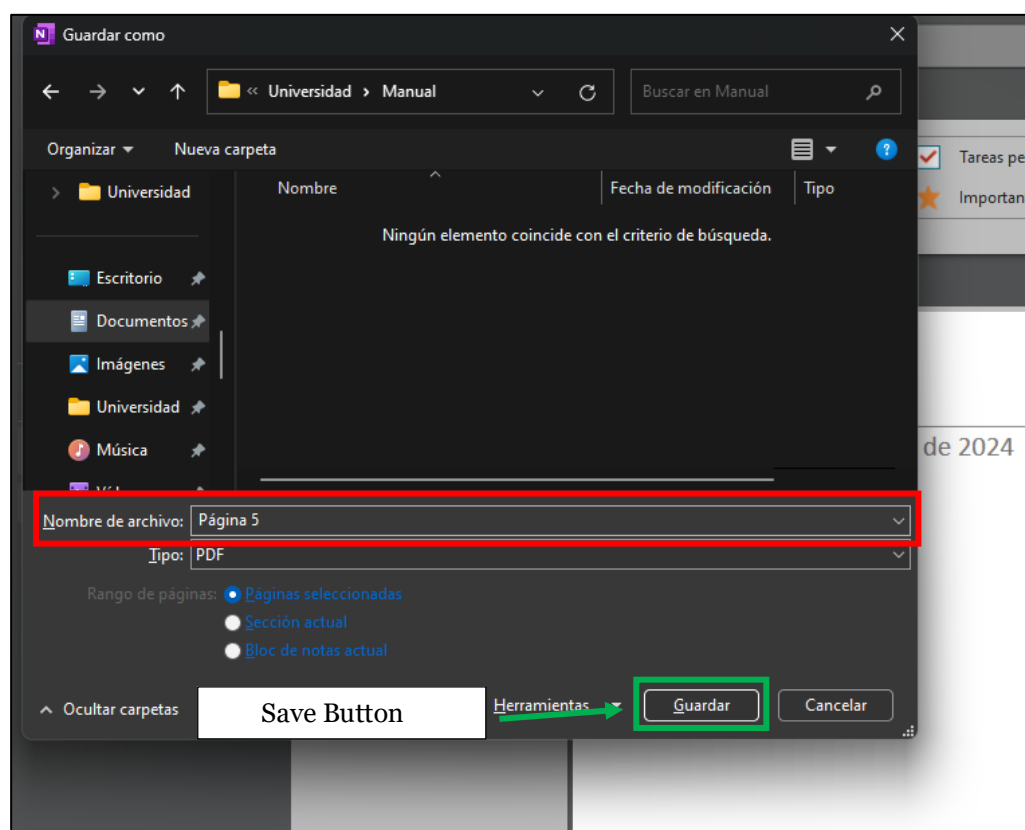

Press the "Export" button.

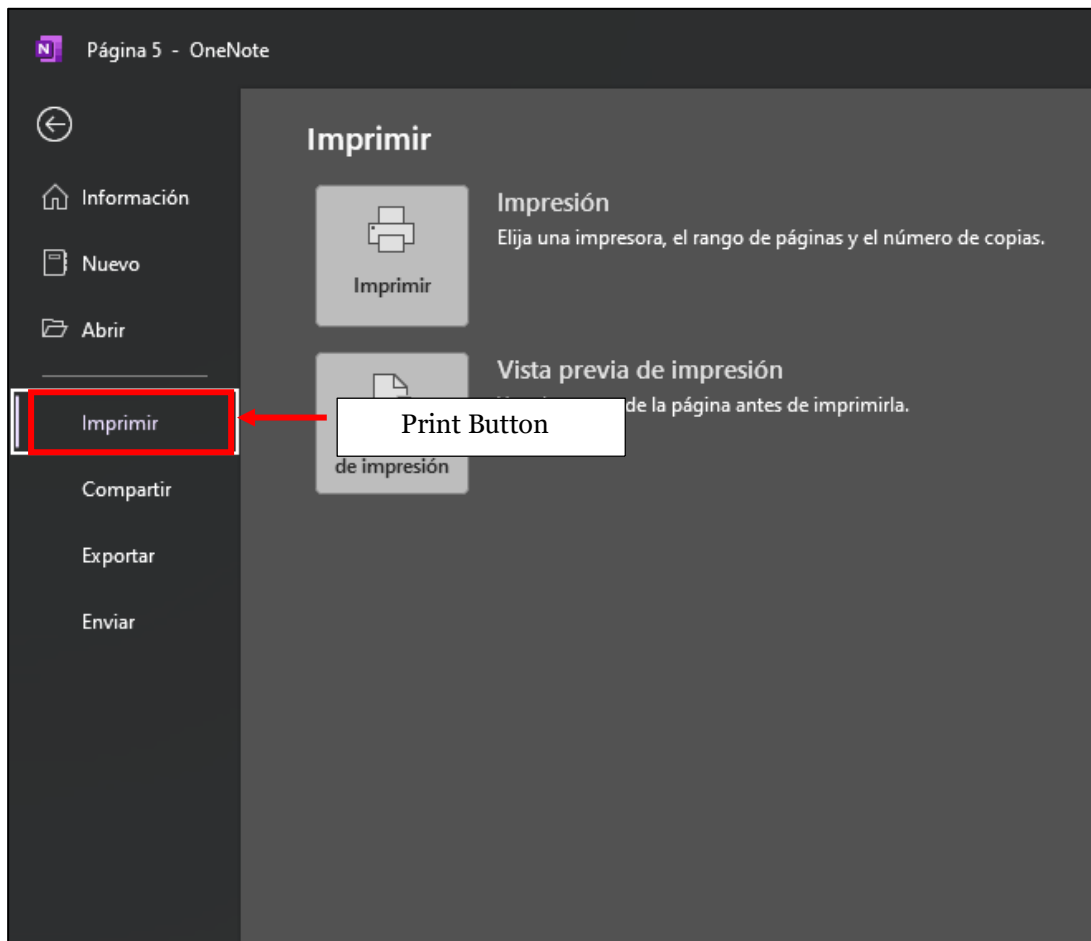

At this point, the user must choose what they want to export: pages, a section, or the entire notebook. In this demonstration, we will export a page. It's worth mentioning that the user must be on the page they want to export before pressing the "File" tab.

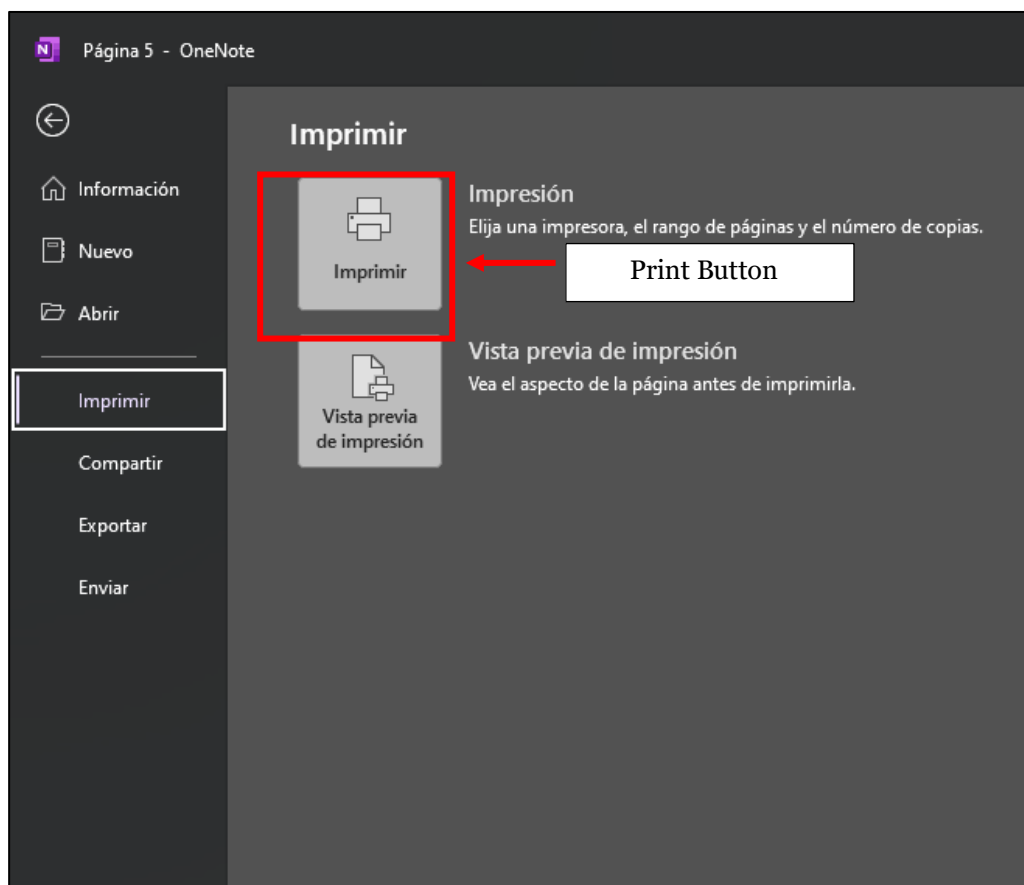

You select the format in which you want to save, the most common ones are PDF or as OneNote itself. Then you press one of the rectangles according to your preferences. After choosing one of the red rectangles, go to the "Export" button, in the green rectangle.

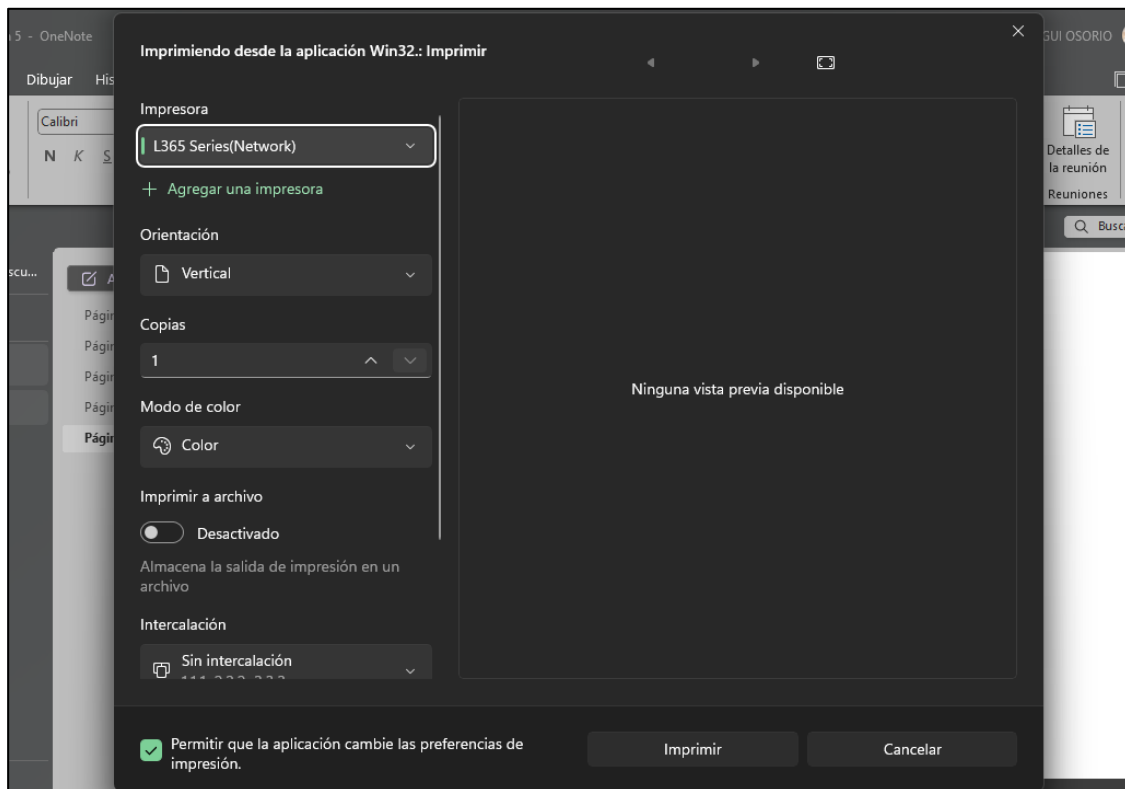

In this tab, if you need to change the name in the red rectangle, just press and type on the keyboard. Then, browse to the location on the computer where you want to save the page, and finally, press the "Save" button in the green rectangle.

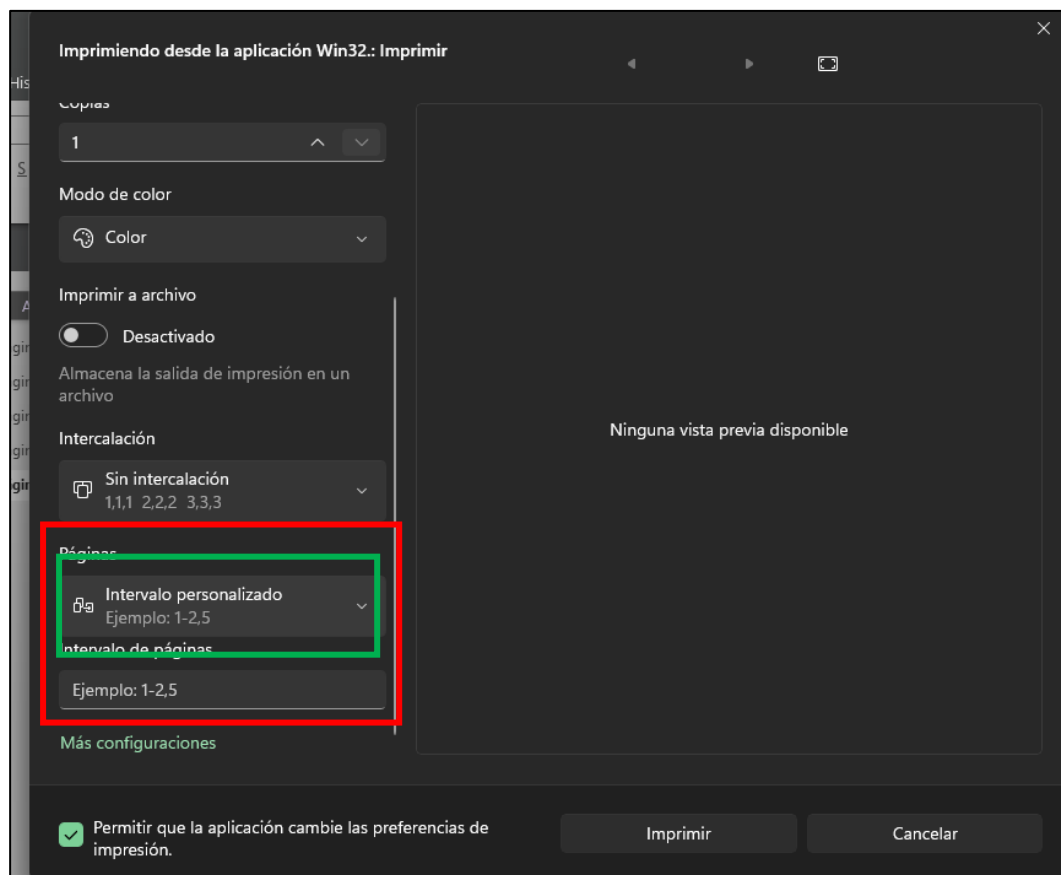

To print, after pressing the "File" tab, press the "Print" button.

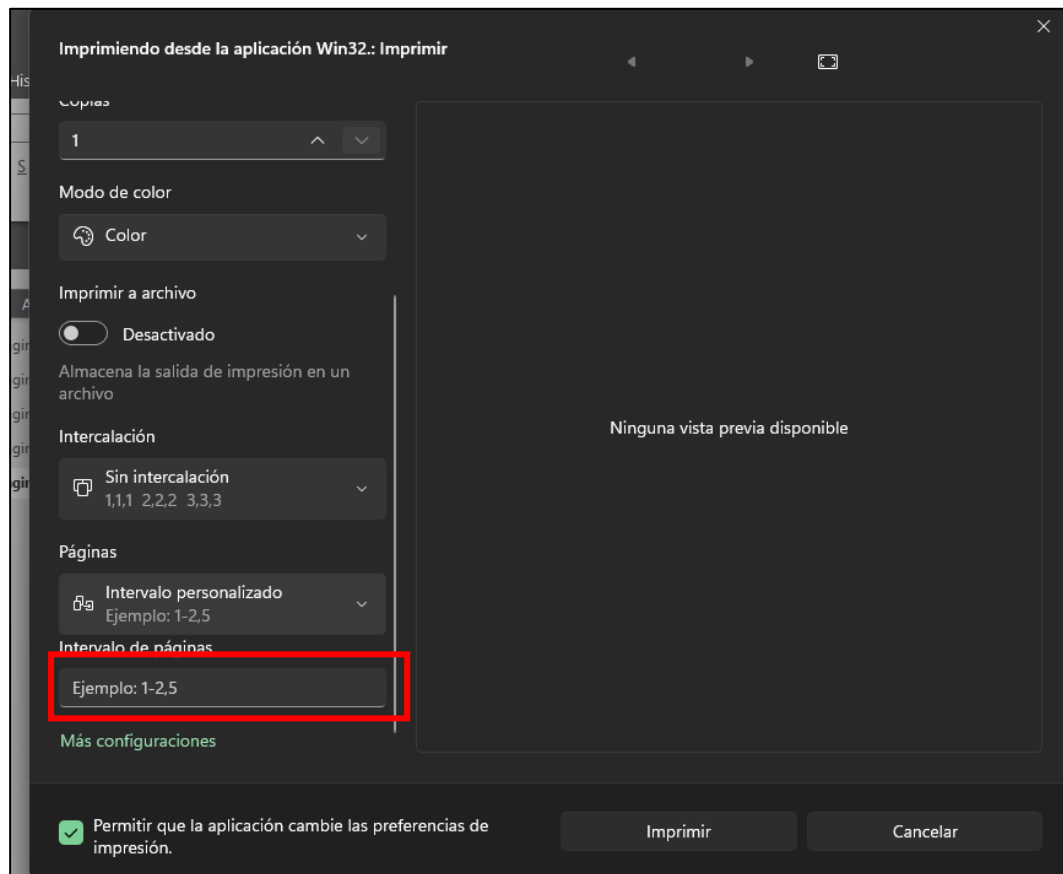

Now, press the "Print" button in the red rectangle.

Another window opens with the relevant information for printing.

When scrolling down, you'll find the page range area, in the red rectangle. Press on the page range, in the green rectangle.

Finally, in the box marked in red, type with the keyboard the pages you want to print.

8. FAQ

- **How do I install OneNote on my computer if I don't have it?**

The OneNote application is part of the Microsoft suite of applications that comes pre-installed on a computer. If the application is not found, you can use a web browser such as Google Chrome, Firefox, Edge, among others, to search for OneNote along with the word "download" to go to the official application page and install it.

- **Is it possible for anyone to access my notes and read the information?**

For this question, different perspectives must be considered. If we're talking about whether a completely unknown person can, from the Internet, access the notes, then no, unless the computer has a virus, which only occurs through improper handling. On the other hand, if we're talking about a person in real life obtaining the computer and accessing the notes, then that can happen. However, there are several options. The simplest one is to put a password on the entire device so that all the information inside is encrypted.

- **Can I edit my notes from another application other than OneNote?**

It is possible, however, two things must be taken into account: firstly, for the notes to be managed from another external application, they would have to be exported from OneNote to Word, PDF, or plain text; secondly, the best environment for editing the notes will be OneNote, so if you don't want to risk damaging the information, it is preferable and appropriate to stick with OneNote for editing.

- **If I stop using OneNote, will my notes disappear at some point?**

No, the notes remain where they were saved. If they were saved on the computer, or were initially created there, then they will always remain in that space unless the user deletes them, or the computer becomes damaged for some reason. So, if a note is created one day and years go by without using OneNote, the note will still be available on the computer as long as it continues to function.

- **What is the difference in using OneNote for notetaking compared to other writing applications like Word?**

The difference lies in ease and efficiency. While Word is an excellent application for writing documents, OneNote is excellent for taking notes and creating notes. So, of course, notes can be taken in Word; however, if you want to have labels, note formats that resemble handwritten notes, OneNote is the best option.

9. Glossary

Term	Description
OneNote	Microsoft application for creating and editing notes.
Microsoft	Multinational American company primarily recognized in the field of computing.
ICT	Information and Communication Technologies are resources for distributing information through technological devices.
Screen	Current image that can be seen on the computer screen.
Mouse	It is one of the devices connected to the computer that allows interaction with the computer. It has two buttons, the left and the right.
Pointer, cursor	It is the arrow symbol that is controlled by the mouse.
Style	In this context, "style" refers to the characteristics associated with a piece of text. The set of characteristics applied to that piece of text would be the text's style.
Link	It is a direct connection between two virtual spaces; by clicking on them, you can go to a virtual site linked only by this hyperlink. Composed of letters and symbols, it is usually underlined and has a bluish tone.
Programming language	Series of instructions or commands that allow a person to communicate with the computer.
Code	Plain text written by a person in a programming language.
