1. Project Objectives

Train teachers of the Ministry of Education in the use of ICT tools to improve their teaching performance, in order to promote educational innovation and online learning.

Train priority attention groups or those who are digitally illiterate in the use of ICT tools to apply what they have learned in their daily lives, promoting their digital inclusion and improving their quality of life.

2. Objective of the Manual

The main objective of this User Manual is to provide users, especially those who are dabbling in the use of search engines, a detailed and easy-to-follow guide to efficiently navigate the web. Through clear instructions based on the topics of the videos provided, the manual seeks to help users understand the basic operation of search engines, optimize their searches with keywords, differentiate between organic and advertising results, filter results by type of content, browse safely and protect your privacy. Additionally, it focuses on exploring advanced features, solving common problems, and fostering mastery in online searching, summarizing acquired skills and encouraging continuous exploration to maximize the user experience.

3. Scope

This User Manual aims to provide a comprehensive guide for users, especially those new to using search engines, to develop solid web browsing skills. The scope ranges from understanding the basic operation of search engines, effective navigation, and interpretation of results, to advanced use of functions such as voice search, image search and filtering by content type. Included are guidelines for safe searching and privacy protection, as well as troubleshooting and answers to frequently asked questions. The intent is to empower users to use search engines efficiently and safely, encouraging continued exploration and mastery of the tools available in online search.

4. Addressed to

This User Manual on Efficient Search Engine Browsing is aimed at a wide audience ranging from novice users in the use of web technologies to those with some experience. It has been designed with the diversity of users in mind, from individuals taking their first steps in using search engines to those looking to improve and optimize their online search skills.

The focus is to make the manual accessible and understandable to everyone, regardless of your level of familiarity with digital tools. This includes students, professionals, seniors, and any individual interested in maximizing their efficiency when searching for information on the web.

The manual is structured to be a useful and friendly tool that adapts to the needs of a diverse audience, promoting inclusive and effective learning in the field of online search.

5. Application introduction

This manual is based on the use of a standard web browser to carry out all activities related to efficient search engine navigation. The choice to use a common web browser, such as Google Chrome, Mozilla Firefox, or Microsoft Edge, is based on the widespread accessibility of these platforms and their wide adoption worldwide. These browsers offer a friendly interface and consistent functionality, allowing users to apply the lessons learned in this manual in a practical way. Regardless of the specific browser used, the essential functions and tools mentioned in this manual are universally applicable. Users are encouraged to use the browser they are most comfortable with or that best suits their preferences.

personal. This approach ensures that the skills acquired can be applied effectively in a variety of online environments, thereby contributing to the improvement of the overall Internet search experience.

6. Basic notions

Before diving into the universe of search engine navigation, it is essential to establish some fundamental notions that will provide you with a solid foundation to make the most of this crucial tool in the digital age. Here we present some of these essential notions:

1. **Motor Search Engine:** In the digital context, a search engine is the gateway to vast knowledge on the web. Works like a digital librarian that explores and organizes online information, helping you find specific data efficiently.
2. **Essential Operation:** Understanding how search engines work is key. They are like digital explorers that crawl the web, index relevant information and present it when you perform a search, making sure you get relevant results.
3. **Search Bar and Basic Buttons:** The search bar is your main tool. You will learn to enter effective queries and use basic buttons like "Search" and "I'm going to get lucky" for quick results.
4. **Search Results:** When you click "Search", you will be faced with a list of results. These results are like chapters in a digital book, and you will learn to explore them to find the information you need.
5. **Pagination:** If there are more results than you can see on a single page, pagination comes into play. You will discover how to navigate through different pages to find more digital treasures.
6. **Keywords and Effective Search:** Keywords are your magic keys on the web. You'll dive into how to formulate effective and precise queries to get relevant and specific results.
7. **Difference between Organic and Advertising Results:** You will identify the distinction between organic and advertising results, understanding how search engines present information in a clear and relevant way.
8. **Understanding Search Results:** You will delve deeper into interpreting links, descriptions and evaluating the relevance of results, learning to use pagination to explore further.
9. **Keywords and Effective Search:** You will return to keywords and effective search, focusing on precision to obtain results that are more tailored to your needs.
10. **Exploring Search Engine Features:** You'll go a step further and discover advanced features, such as voice search, related images, and search by date range, that will improve your online search skills.

By understanding these basics, you will be prepared to delve even further into the exciting world of search engine navigation. Let's explore together!

7. Steps to follow

Video 1: What is a Search Engine?:

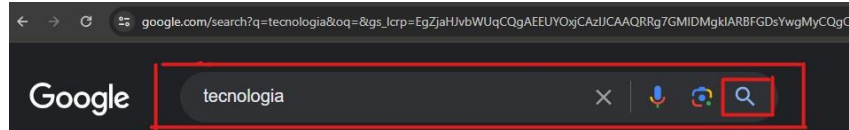

To get started, open your favorite web browser, such as Google Chrome or Mozilla Firefox.

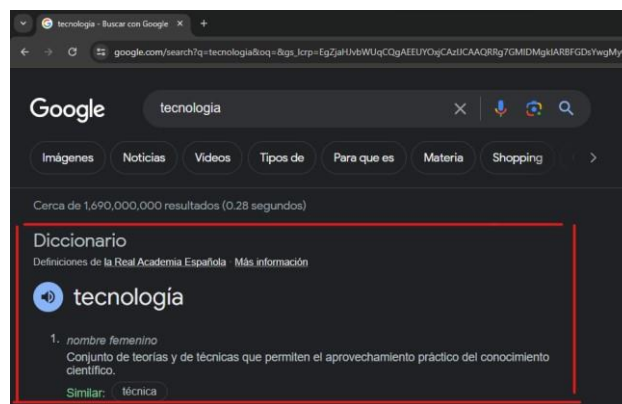

Type the URL of your preferred search engine, such as Google, Bing, or Yahoo, into the address bar.

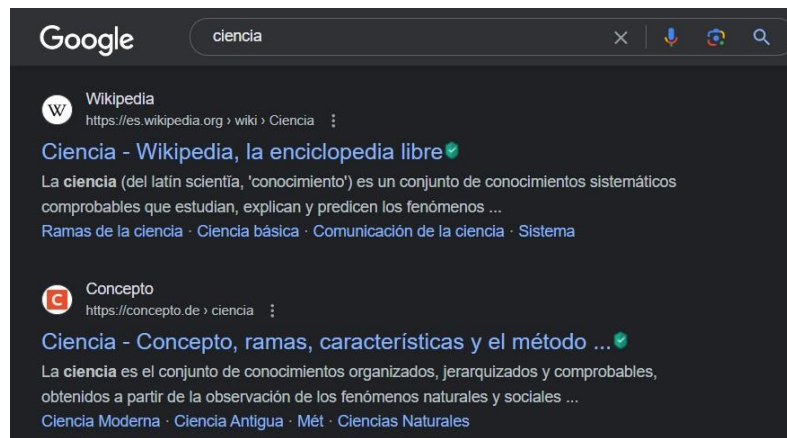

Once in the main interface of the search engine, direct your attention to the central search bar. This is where you will enter your queries. To practice, type a simple question or key term that interests you and press the "Enter" key or click the search button.

Now, look carefully at the results page that appears after performing the search. Examine the titles, descriptions and links presented, as these correspond to your query. This process will help you understand how the results are displayed and how to interpret them.

Take this opportunity to familiarize yourself with some of the most popular search engines, such as Google, Bing, and Yahoo. Perform simple searches on each of them to compare the results and notice possible differences.

Video 2: Navigating a Search Engine?:

Open your preferred web browser on your device. Make sure you are connected to the internet.

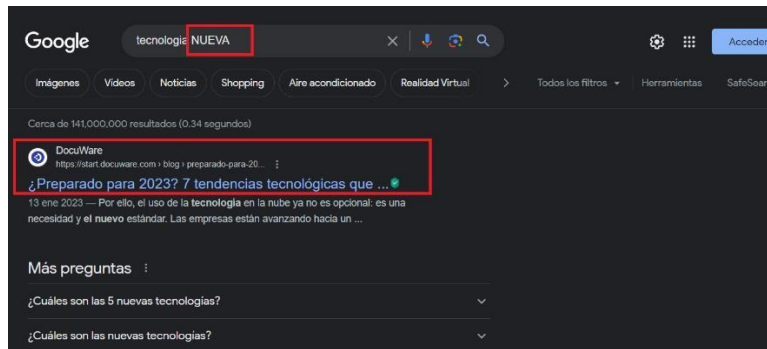

Enter the URL of your preferred search engine into the browser's address bar (e.g. Google, Bing, Yahoo) and press "Enter."

Once on the main page of the search engine, focus on the search bar.

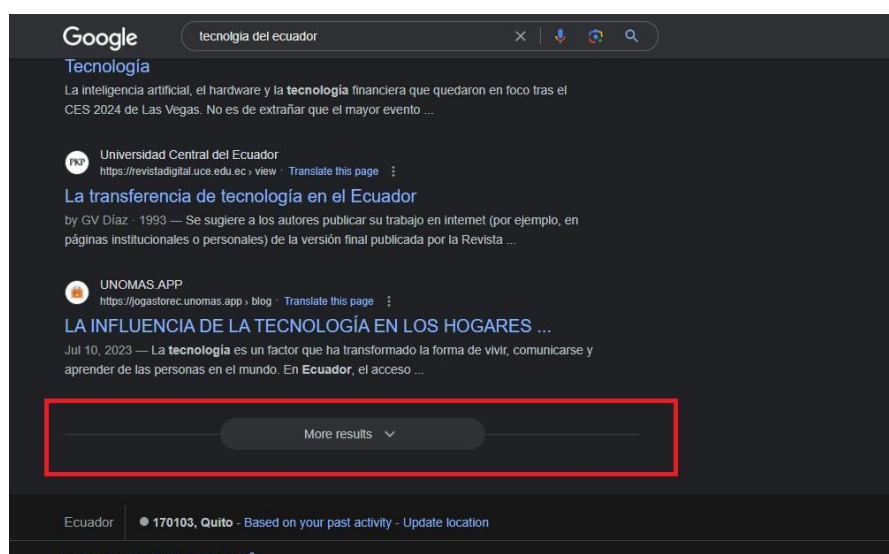

Practice entering various queries or key terms to get specific results. Interact with key buttons, such as "Search." See how they affect the results and experiment with various queries.

After performing a search, examine the results presented on the page. Click on various links to explore different sources and types of content in this case the link in the image above.

If there are more results than you can see on a single page, practice pagination. Browse through different pages to familiarize yourself with this feature.

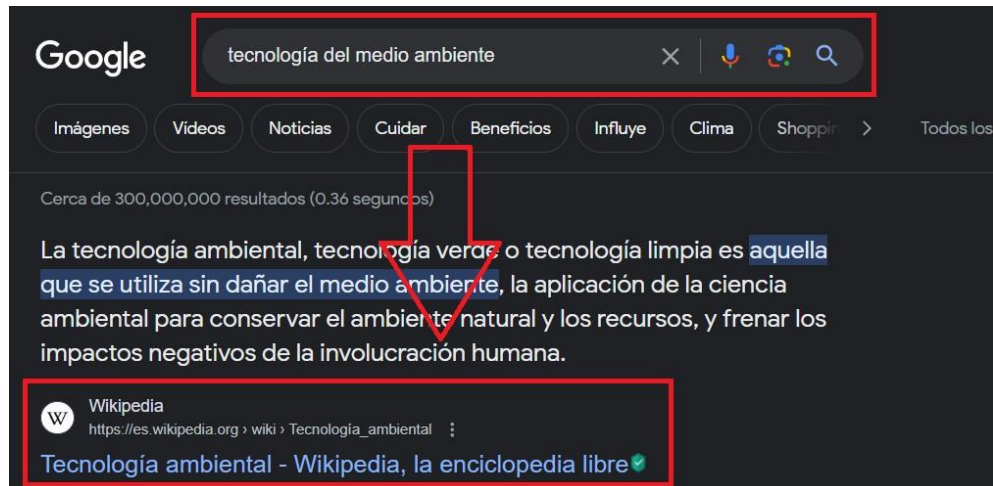

Video 3: How Search works and what it shows

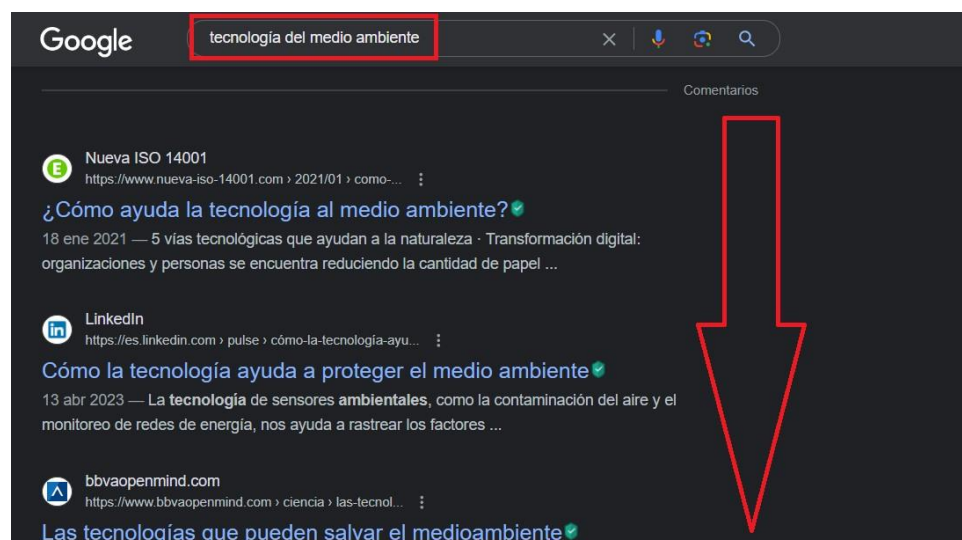

Imagine search engines as tireless explorers that navigate the web. Understand that they quickly index all relevant information, creating one giant index.

When you enter a search, the results appear as if on a detailed map. Understand that these results are like the "X" that indicate the exact point in the search carried out.

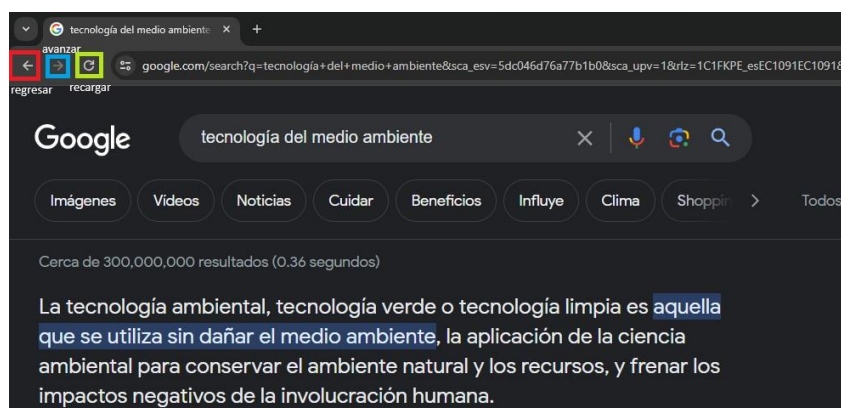

It takes attention away from the on-screen demonstration that shows a search and how the results match the query.

The importance of the algorithm, a sophisticated mathematical formula that classifies the results. Visualize how the algorithm orders the results from the most relevant to the least relevant.

Pay attention to important buttons, such as "Back" and "Forward", which will allow you to go back or forward to pages already viewed. Familiarize yourself with the reload button to reload the page, simulating a new login. These are located at the top left of most browsers.

Reflects on the importance of how search engines explore and organize the web.

Video 4: Understanding Search Results

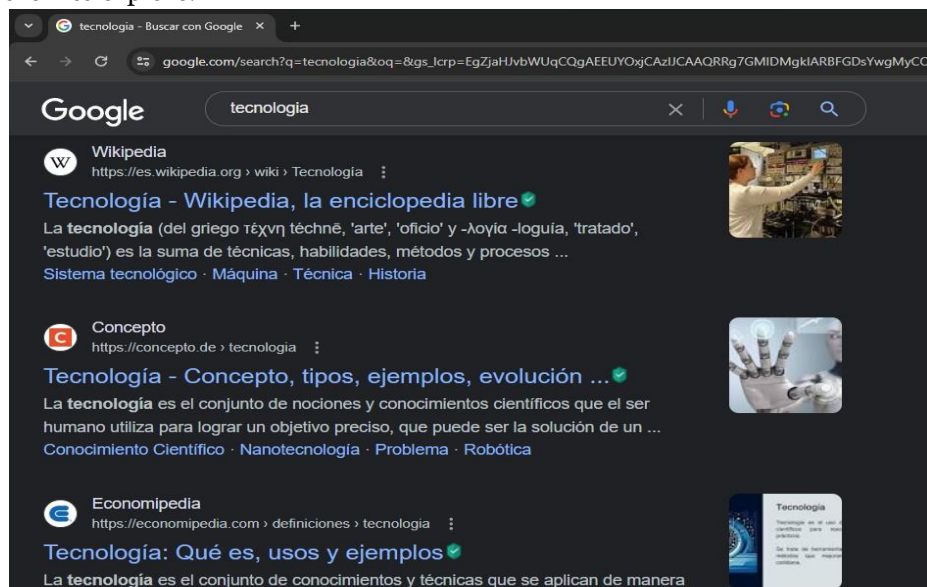

Abre your preferred web browser on your device. Make sure you are connected to the internet.

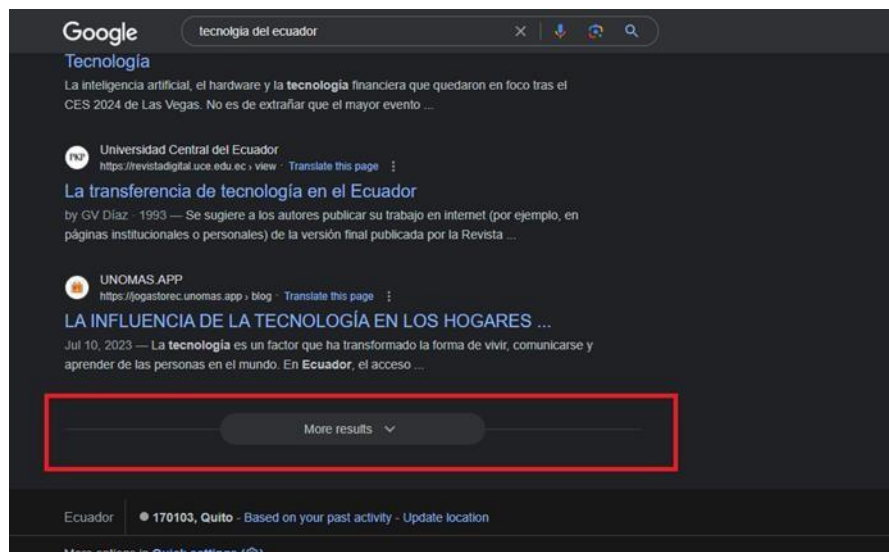

Enter the URL of your preferred search engine into the browser's address bar (e.g. Google, Bing, Yahoo) and press "Enter."

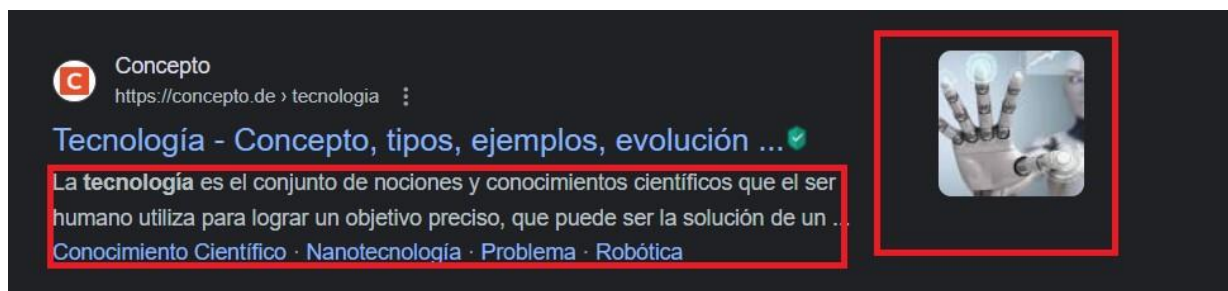

Observes the list of results that appear after your search. Each link is like a door to new information you can click on them to explore.

If there are more results than you can see on one page, use pagination. Explore how to navigate between pages to access more information.

It's also important to learn about additional features, such as featured snippets and images in the results.

Finally, recap what you learned about links, descriptions, and relevance in search results.

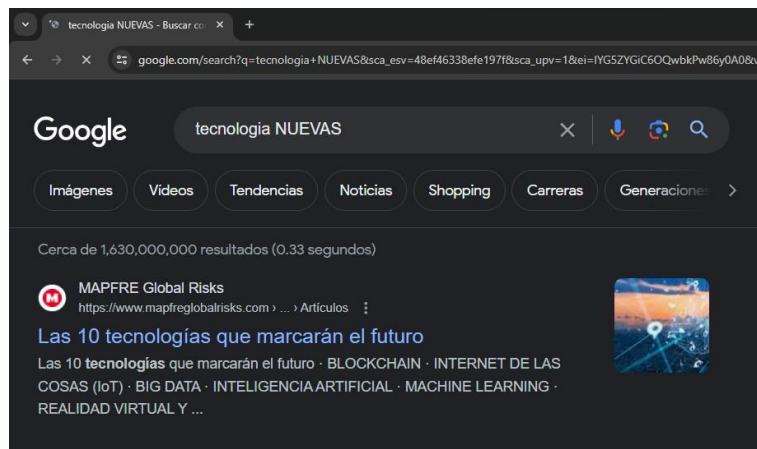

Video 5: Keywords and Effective Search

Abre your preferred web browser on your device. Make sure you are connected to the internet.

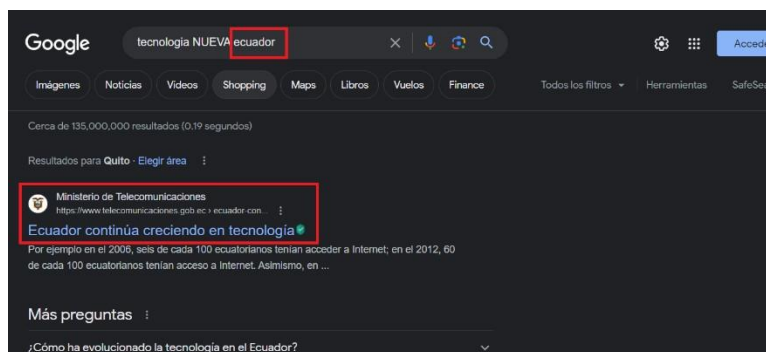

Enter the URL of your preferred search engine into the browser's address bar (e.g. Google, Bing, Yahoo).

Understand that keywords are like magic keys that open doors of information on the web.

Learn to formulate effective queries by being specific and using relevant keywords. Following the image demonstration, see examples of how to improve your searches.

Recognizes the importance of precision in searches. Search algorithms interpret keywords to provide more accurate results.

Video 6: Difference between Organic and Advertising Results

Open your preferred web browser on your device. Make sure you are connected to the internet.

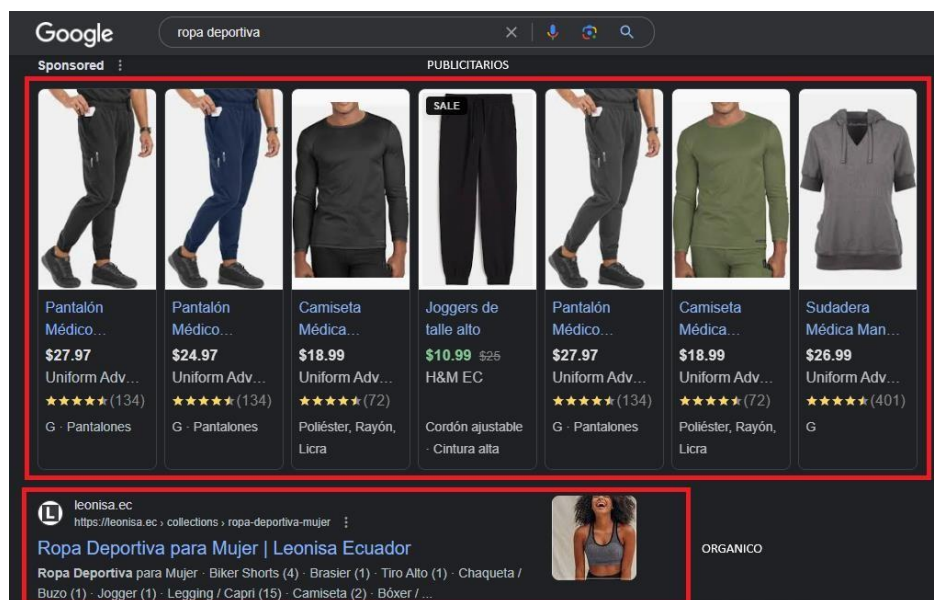

Enter the URL of your preferred search engine into the browser's address bar (e.g. Google, Bing, Yahoo) and press "Enter."

Understand that there are two main types of results: organic and banner ads.

- Helps identify an advertisement. These are usually labeled “Ad” or “Advertising” and are often located at the top or side of the page.
- Recognizes the importance of relevance in the results. Search engines seek to offer relevant results, whether organic links or ads.

See the on-screen demo that shows examples of how these results are presented on a search page.

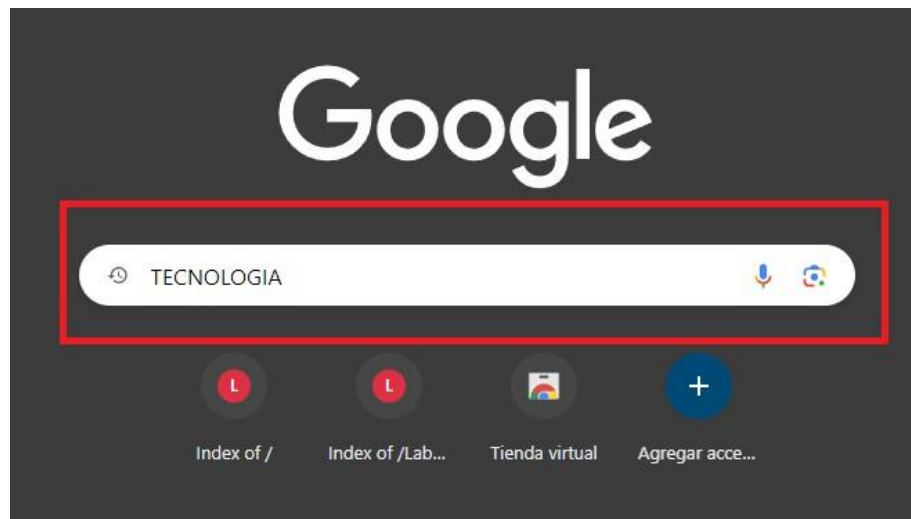

Video 7: Filter Results by Content Type

Open your preferred web browser on your device. Make sure you are connected to the internet.

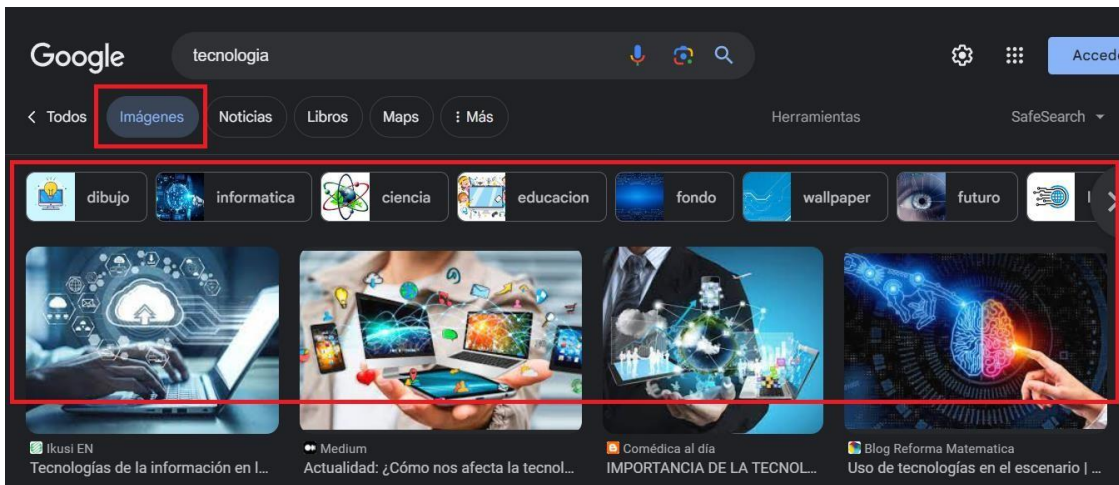

Enter the URL of your preferred search engine into the browser's address bar (e.g. Google, Bing, Yahoo) and press "Enter."

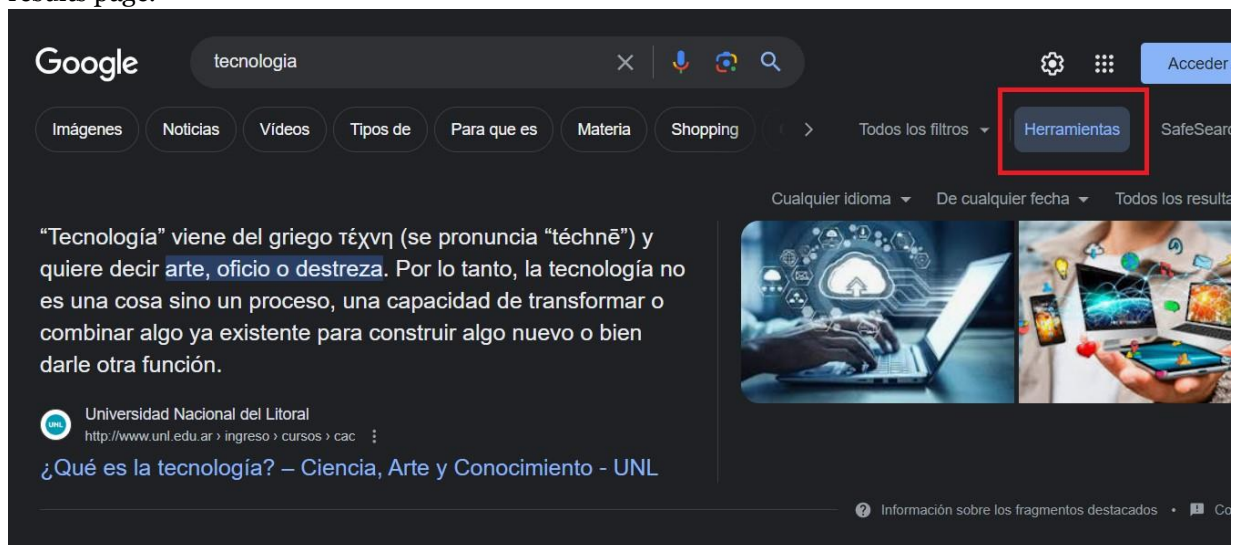

Know that search engines offer more than just links. You can browse images, videos and news directly from the search bar. You can select these elements at the top of the search results page.

Display the screen to learn how to switch between image, video, and news results. This will allow you to customize your search based on the type of information you are looking for.

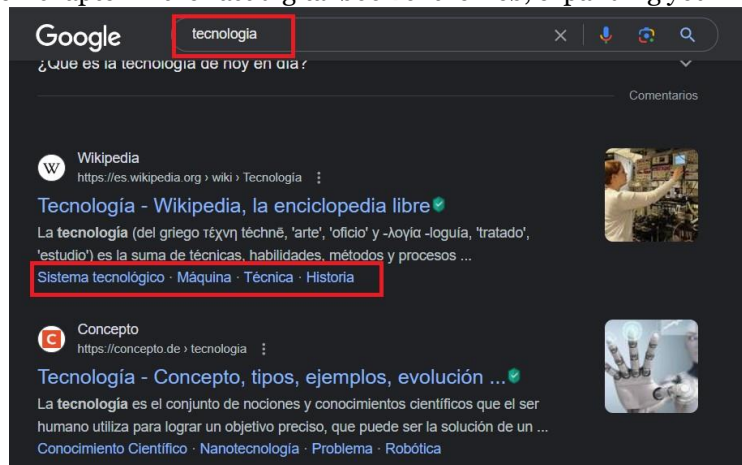

Find the "Search Tools" or basic filters located on most engines. These tools will allow you to refine your results based on different criteria, such as date, relevance, and more. This is located at the top of the search results page.

Using basic filters, adjust your results based on temporal relevance or importance. Learn how to use these tools to find updated or classic information according to your needs.

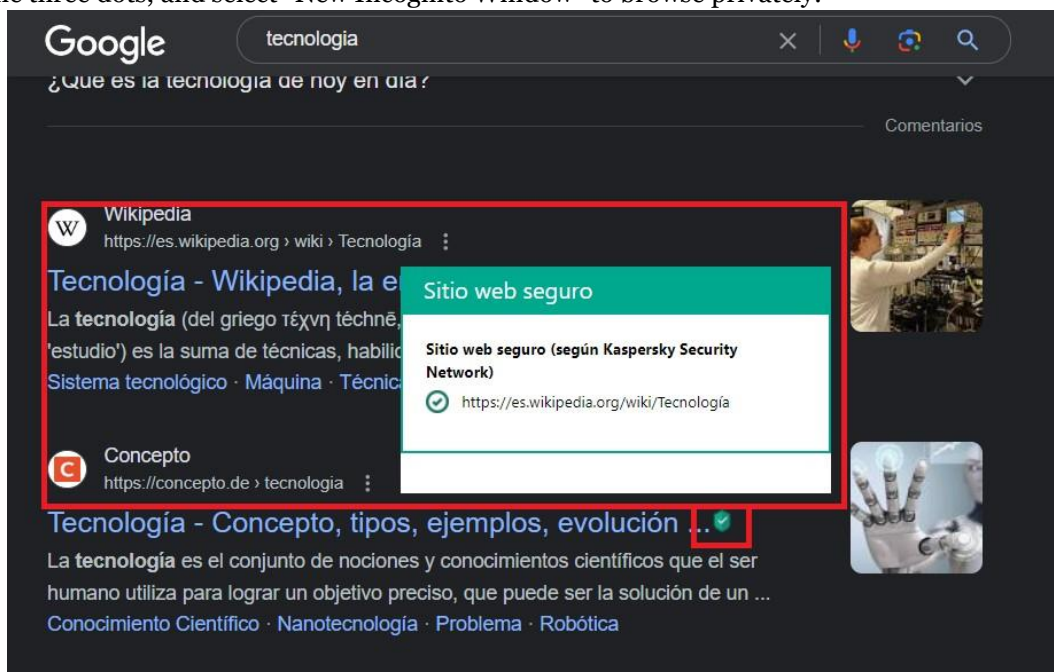

If you want to delve deeper into a specific topic, explore the related links that appear next to the results. It's like opening a new chapter in the vast digital book of the web, expanding your horizons of knowledge.

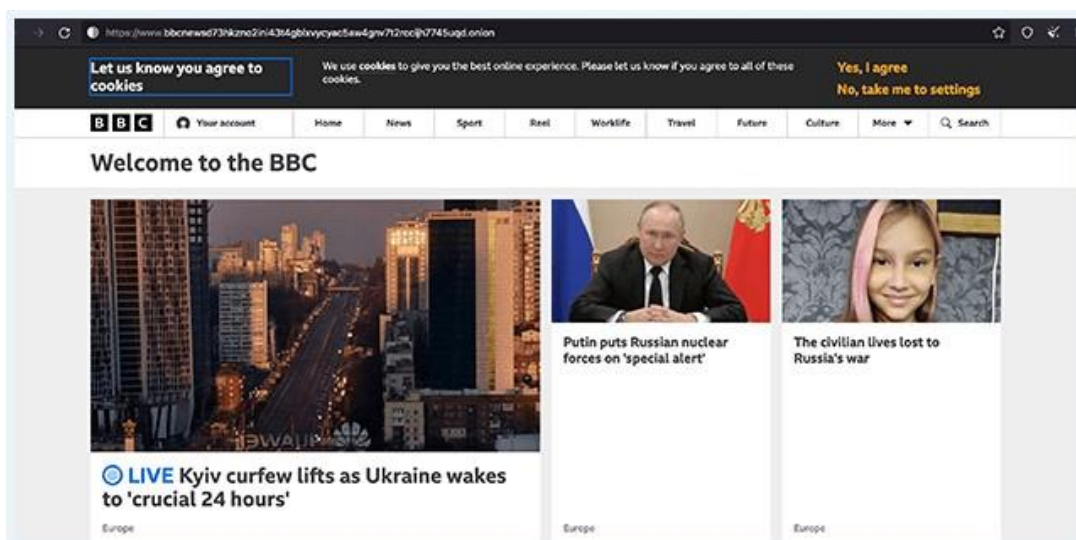

Video 8: Safe Browsing and Privacy

When you search, security is essential. Search engines indicate whether a result is safe or not. Pay attention to these indicators before clicking on a link. Protecting your privacy is essential. Some search engines offer options to search privately, where your search history is not recorded. Head to the top right, click the three dots, and select “New Incognito Window” to browse privately.

When searching for information, be alert for possible scams or phishing sites. If something seems too good to be true, it could be a trap. Recognize warning signs and prioritize safe pages that appear at the top of search results. As there are too many ads and links all over the page.

Remember that nothing on the internet is really free. Be cautious when you are offered exceptional benefits, as these could be scamming attempts. As you scan the search engine, scam pages may increase, so keep your guard up.

Video 9: Exploring Search Engine Features

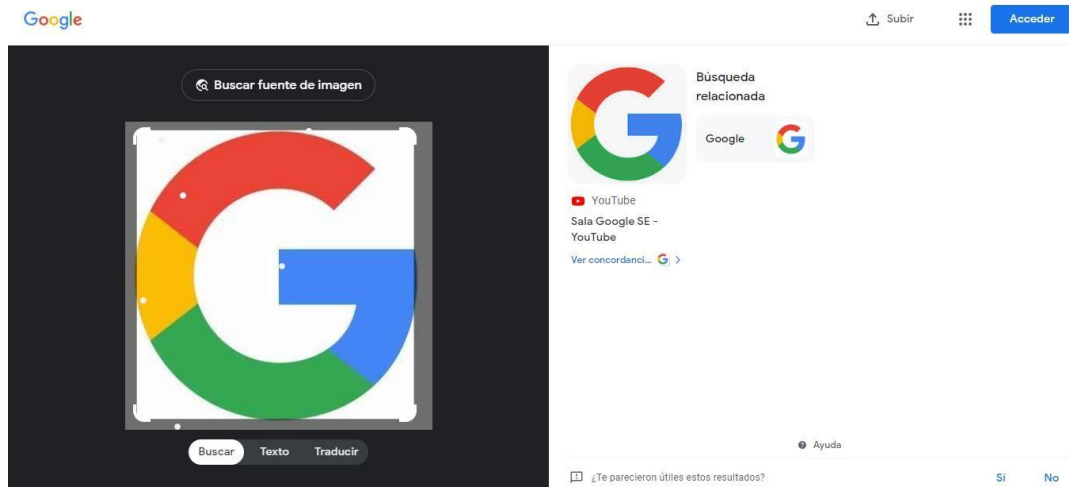

Experience a more intuitive search using the voice search feature. Click the microphone icon, talk about the topic you're interested in, and watch the search engine perform the search based on your voice.

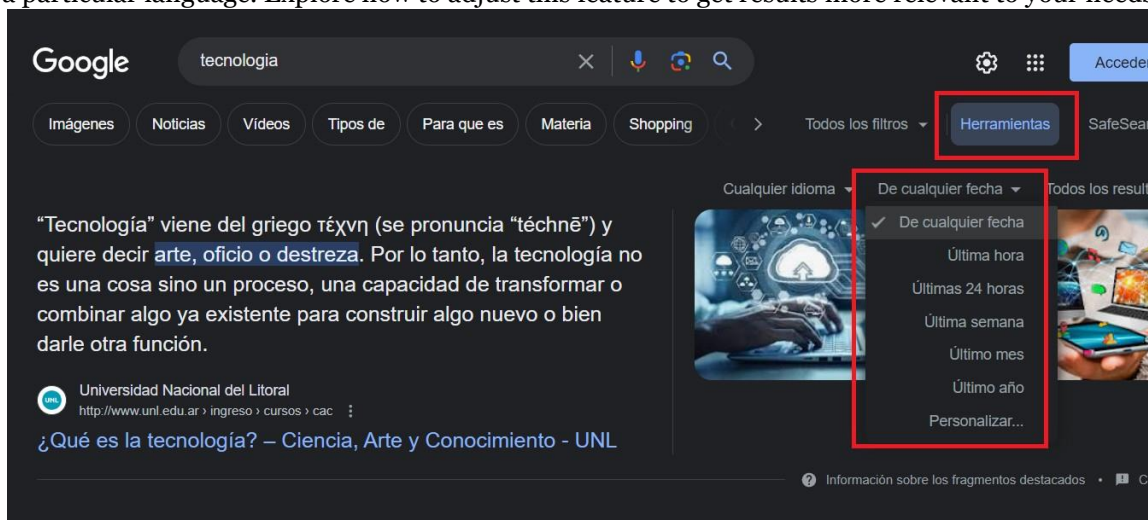

Explore the visual world beyond words. Use image search to find related images or perform a reverse search by uploading a specific image. Click the camera icon.

Pull up an image and watch the search engine show you related results.

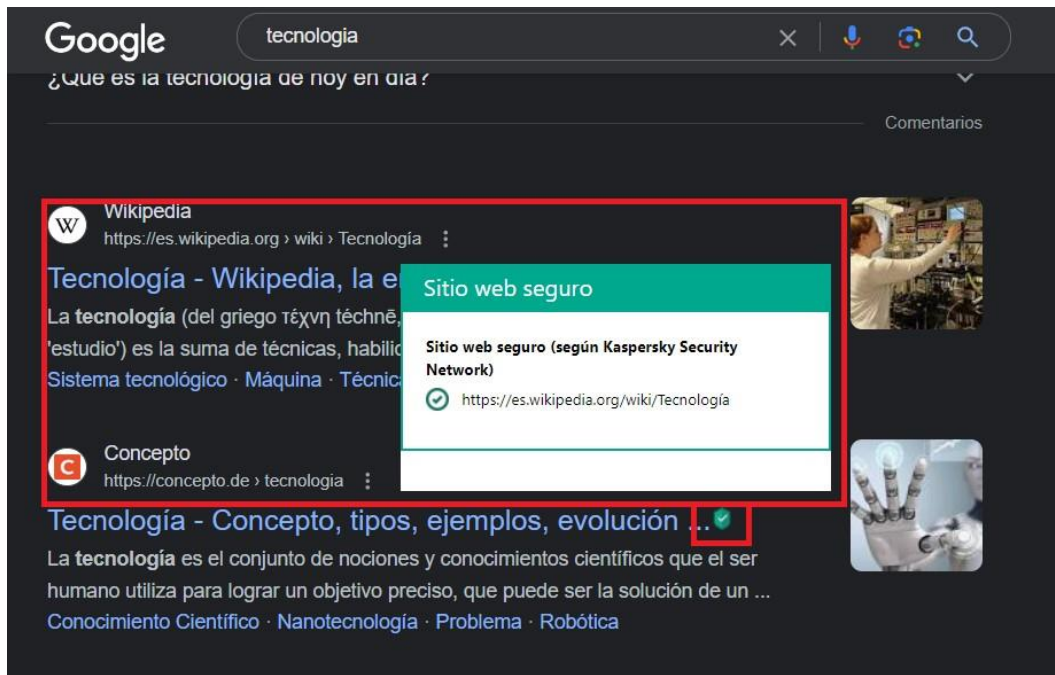

Refine your searches by adjusting the date range. Ideal for finding specific information in a certain period or a particular language. Explore how to adjust this feature to get results more relevant to your needs.

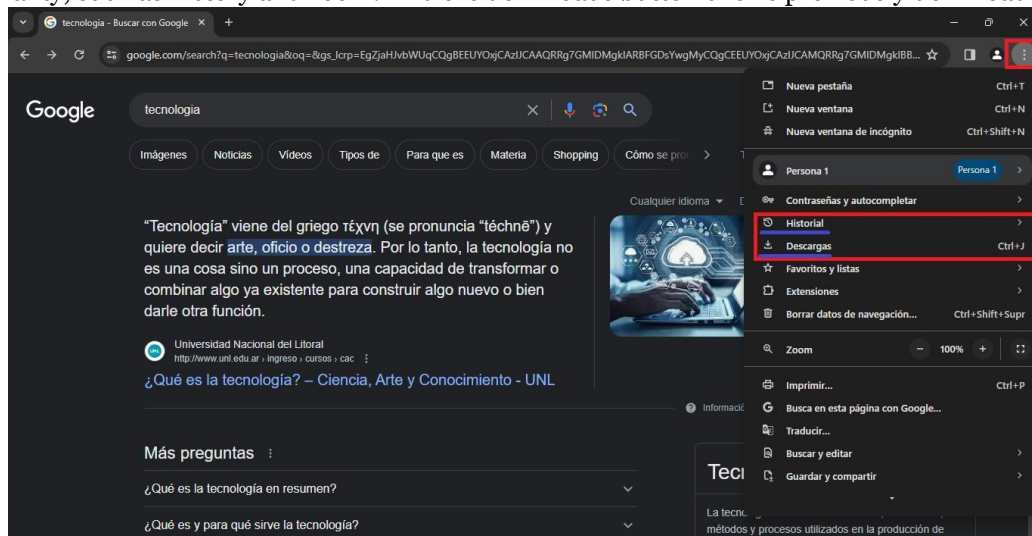

Video 10: Frequently Asked Questions and Practical Tips

We will explore factors such as relevance and popularity that influence the order of results. the key to being a search expert is constant exploration. Don't be afraid to experiment with different keywords, filters and functions. The more they practice, the more efficient they will be at finding the information they need.

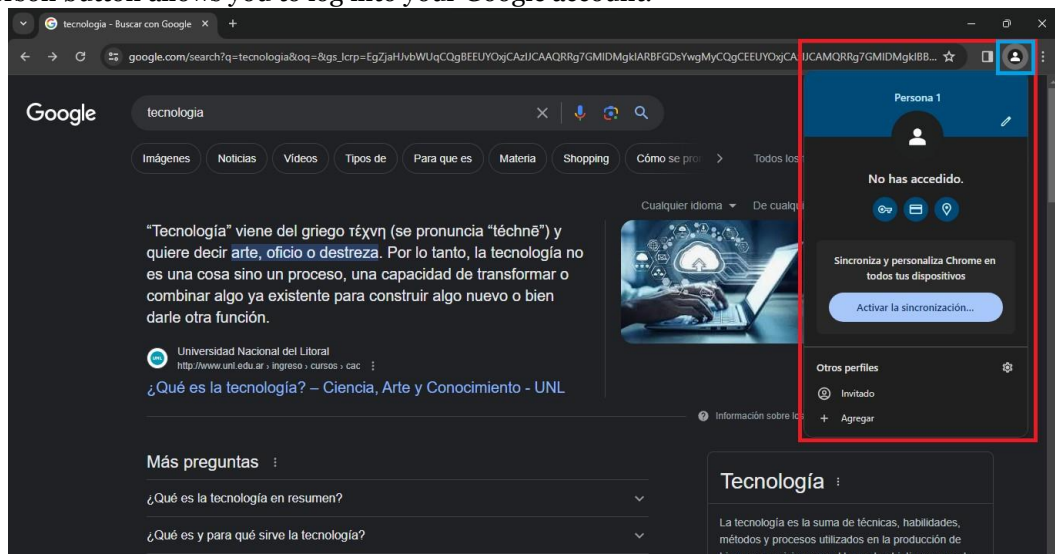

When seeking critical information, evaluating the credibility of sources is vital. Learning to recognize trustworthy sites will help you obtain accurate and reliable information.

Discover additional tools such as the three-dot button, which opens more options, and learn about its functionality, such as history and zoom. And the downloads button shows previously downloaded files.

The person button allows you to log into your Google account.

Practice constant exploration to improve your skills. Always evaluate the credibility of sources before trusting information and use additional tools to personalize your search experience.

8. Frequently questions

1. How can I improve the accuracy of my searches?

- Use specific and clear keywords.
- Experiment with different combinations of terms.
- Take advantage of advanced search engine features, such as using quotes to search for exact phrases.

2. How do I distinguish between relevant and non-relevant results?

- Use the description below each link to evaluate relevance.
- Pay attention to the publication date for updated information.
- Use the search filters to refine the results according to your needs.

3. How do I avoid unsafe websites or potential scams?

- Verify the site URL before clicking.
- Avoid providing personal information on suspicious sites.
- Trust known sources and verify the authenticity of the information.

4. What is the difference between organic and advertising results?

- Its results are generated naturally by the search engine.
- Its advertising results are paid and are labeled as "Ad" or "Advertising".
- Both can be relevant, but organic is not influenced by payments.

5. How do I protect my privacy while searching online?

- Use private browsing or incognito modes in your browser.
- You understand the privacy policies of search engines.
- Consider using VPN services for an extra layer of privacy.

6. What should I do if I can't find the information I'm looking for?

- Refine your query using synonyms or related terms.
- Go check the spelling of your keywords.
- Explore different sources or change your search focus.

7. What is the importance of voice search?

- The search offers a faster and more convenient experience.
- You can search while you're on the move or with your hands full.
- It is an excellent option for more natural and conversational consultations.

9. Glossary

Term	Description
Search Engine	Online tool that explores and organizes the information available on the web to offer relevant results to user queries.
Search bar	Interface where users enter their queries or keywords to perform searches on a specific engine.
Organic Results	Links that appear on search results pages naturally, without paying for advertising.
Advertising Results	Paid links displayed on search results pages, identified as "Ad" or "Advertising."
Search Algorithm	Mathematical formula used by search engines to rank and order results based on relevance to the user's query.
Crawling and Indexing	Process in which search engines explore and record information from web pages to organize it in their index.
Keywords	Specific terms used in a search query for obtain accurate and relevant results.
Pagination	Feature that allows users to navigate through different results pages when there is more information than can fit on a single page.
Voice search	Method that allows users to search by speaking instead of typing, using voice input on compatible devices.
Search Filters	Tools that allow users to refine and personalize search results based on specific criteria, such as content type or date.
Private Browsing	Browsing mode that does not save search history or session information, providing greater user privacy.
Quick Indexing	Agile process by which search engines register new web pages in their index.
Advanced Filtering	Using more specific criteria to refine search results precisely.
Local Results	Information displayed in search results based on the user's geographic location.

Boolean Query	Using operators such as AND, OR, NOT to combine or exclude terms in a search.
SEO (Optimization for Search engines)	Strategies and techniques to improve a website's visibility and ranking in organic search results.
SERP (Results Page Search Engine)	Page that displays the results of a specific search on a search engine.
Crawler (Crawler Robot)	Automated program used by search engines to explore and analyze web pages.
Backlink (Backlink)	Link from an external page to a specific page, used as an indicator of relevance and popularity.
Image Indexing	Process by which search engines record and catalog images for retrieval in specific searches.
